	@cosmic_adventure777 @stellarodyssey	Instagram	https://www.instagram.com/p/DCGTVpqxB-h/	IFT-2 Launch: An Amazing Morning of Rocket Power! 🌅🌟 Launch Highlights of IFT-2 🌟 Orange and purple hues filled the early morning sky as I set up my camera to record one of the most amazing events—the IFT-2 rocket launch. 🚀 The countdown reverberated, hearts pounded, and then the rocket exploded into flames! 🔥🌟 The launcher propelled the spaceship off the runway and into the sky, displaying an almost tangible sense of raw force and energy. An incredible experience! 🌟🌟 A few seconds later, the sound wave came, a deep rumbling that you could feel in your chest! It was captivating to watch the rocket burst through the clouds, trailing smoke in its wake. It served as a reminder of the insatiable human quest for knowledge and travel. The booster's separation during the stage separation was very remarkable, producing a breathtaking visual display in the morning sky. Everyone was in awe of this operation's magnitude and accuracy. 🌟🌟 It was exciting and difficult to take these pictures, but each one captures a different aspect of the amazing journey that started from that launch pad. 🚀 Do not pass up the opportunity to see a launch in person if you ever get the

Excerpt from "In Praise of the Jellyfish" by American Poet and Author @lucillelangday. ROV pilots filmed this siphonophore during the #SouthSandwichIslands expedition, where a team of international scientists is characterizing biodiversity and examining geohazards along the seafloor in extremely remote locations. The closest humans to our ship, the Research Vessel Falkor (too), may be orbiting the Earth on the International Space Station! 🌟 Howdy neighbors in the @iss - we're waving at you. 🙌	
	@jonoallenphotography via @bluewhaleshub	Instagram	https://www.instagram.com/p/DA9Gk6fQBe4/	One of the rarest animals on our planet. Meet Māhina, the luminescent all white humpback whale calf. Māhina (meaning "moon" in Tongan) was born near to the islands of Vava'u and was first seen in August this year. Her complexion is so illuminating and glowing white she appears like a bright full moon underwater. Last week I had the completely unexpected privilege of meeting and interacting with Māhina face to face, an encounter of a lifetime and a privilege truly beyond words. There is an estimated 150,000 humpback whales in our oceans, of which perhaps only 3 or 4 individuals share this rare genetic white complexion. Like many young humpback calves Māhina is very curious, confident and playful. She swam straight towards us and briefly interacted with us in the water. Her mother and the male escort whale she is with however, are very protective. It would seem they too are very aware of her uniqueness and the growing attention she is receiving and are going to heightened lengths to keep her safe. Māhina does not have the red eyes often seen in albino individuals, but instead striking black eyes, it's currently unclear if she is an albino or leucistic, or otherwise. Being so illuminating bright she lights up the water an electric fluorescent blue every time she surfaces, it is unlike anything I've ever seen in the water before. While indescribably beautiful to witness, this visual phenomenon also makes her extremely noticeable, both to humans and to potential predators. Although I still worry about her survival, it brings me great relief and hope to see the protective power of her mother and their escort who are staying diligently by her side.

				Words really cannot express the degree of gratitude I feel for having the chance to meet this incredibly rare "spirit of the ocean" mystic individual. I truly hope that I have the privilege of seeing her again as a fully grown luminescent adult some day ❤️ Credits by @ionoallenphotography #whitewhale #humpbackwhale #mahina #humpback	
	@jetlagleah via @bluelifewild	Instagram	https://www.instagram.com/p/DBjJn_Pz0B/	BOOM💣 Edit**📷: Filmed by @jetlagleah **📷 I very, very, rarely post other people's content on this page... but this breach was too good not to share. @dolphindronedom was captain that day and I was flying my drone... one of our amazing guests **edit @jetlagleah ** was rolling iPhone footage when this humpback absolutely launched itself out of the water! The footage was airdropped to me back at the dock and immediately lost in my endless abyss of iPhone whalewatching videos. Today, I relocated it!! If this is your video, please let me know....and thank you!! This video belongs to @jetlagleah !! Good times last year aboard @gonewhalewatching San Diego This encounter happened on the whale's terms. Remember, chasing wildlife in an attempt to create a close encounter is counterproductive and they deserve better than to be harassed. The oceans are worth protecting.	
	Unknown / via @smart_mechanicals	Instagram	https://www.instagram.com/reel/DFSP8MqKIoH/?igsh=c2c1NTljNW9uajM1	✈️ Did you know the F-22 Raptor is often called the king of the skies? What makes it so special? // 🦅 The F-22 Raptor, developed by Lockheed Martin, is a fifth-generation stealth fighter jet built for air dominance. It combines cutting-edge stealth technology, advanced avionics, and unmatched speed and agility, making it one of the most advanced aircraft in the world. // 🌩️ The F-22 can reach speeds of over Mach 2 (1,500 mph) and uses supercruise technology, allowing it to fly at supersonic speeds without using fuel-guzzling afterburners. Its thrust-vectoring engines give it unparalleled maneuverability, enabling sharp turns and quick evasive moves during combat. // 🛡️ Its stealth design makes it nearly invisible to radar, while its advanced radar and sensors can detect and track enemy aircraft long before being spotted. The jet's weaponry includes air-to-air missiles, precision bombs, and a 20mm Gatling gun, making it lethal in both air-to-air and air-to-ground missions. // 🌐 While its main role is air superiority, the F-22 can also perform ground attacks, electronic warfare, and intelligence gathering, showcasing its versatility. // Fun Fact 1: Each F-22 costs around \$150 million, making it one of the most expensive fighter jets ever built. // Fun Fact 2: Its radar cross-section is comparable to that of a small bird, enhancing its stealth capabilities. //Keywords: F-22 Raptor, stealth jet, air superiority, fifth-generation fighter, Lockheed Martin, supersonic flight, thrust vectoring.

	@spacex via @aerospacepage	Instagram	https://www.instagram.com/reel/DGgBIT7Mslr/?igsh=eWhhbWdpMmdxb2M2	The seventh flight test of SpaceX's Starship and Super Heavy aimed to achieve key milestones, including successfully catching the booster and testing an upgraded upper stage design. Although not all objectives were met, valuable lessons were gained to improve future vehicles. The flight, launched on January 16, 2025, featured successful booster ignition and separation, with Super Heavy performing a boostback and landing, including a second successful catch of the booster. However, after stage separation, a leak in Starship's attic area caused fires, leading to a loss of communication and the vehicle breaking apart. The investigation revealed a harmonic response causing excessive stress on the propulsion system, and SpaceX made design changes to prevent future issues. Flight 8, expected to fly this Friday, will incorporate these improvements, continuing the pursuit of full and rapid reusability.

	@historys_mysterie s3.14	Instagram	https://www.instagram.com/p/C_f4tVjOAaj/	The shimmering of the beehive is a remarkable defensive strategy employed by the giant honeybee, native to Southeast Asia. When these bees detect a threat, such as an approaching predator, they execute a synchronized movement that produces a mesmerizing ripple across the surface of the hive. // This phenomenon, known as shimmering, involves thousands of bees raising their abdomens in unison, creating a wave-like motion that moves rapidly from one section of the hive to another. This coordinated display serves as a powerful deterrent, confusing predators and making it nearly impossible for them to target individual bees. The sudden, collective movement disrupts the predator's focus, effectively discouraging attacks. // The shimmering behavior is not just a defensive tactic; it is a sophisticated form of communication that underscores the bees' highly organized social structure. It reflects an advanced level of cooperation and collective response, showcasing the evolutionary prowess of these insects. This behavior stands as a testament to the hive's complex, coordinated defense systems, making it a formidable force in the natural world.	
	@epicwarzyt via @trashcanpaul	Instagram	https://www.instagram.com/p/DJEurv3pCvq/	Not a cell phone in sight (@epicwarzyt)	
	@snehakoppula	Instagram	https://www.instagram.com/p/C2sHDLUygea/	Yesterday while walking past the rock bee nest on farm, I'd noticed this amazing defensive behavior called shimmering, a communal effort to safeguard the nest from predators. In shimmering, a group of honeybees lift their abdomen and shake up in the air, creating a wave like pattern across the hive, signaling the nearby worker bees that there is a threat. This effect prevents hornets or wasps from predating on the bees by generating confusion. As I keenly observed, noticed there are certain areas in the bee curtains where the shimmering response started from, and the speed was changing in different areas of the curtain.

	@texasbeeworks	Instagram	https://www.instagram.com/p/CfT2LaVMTVS/	Bees work together to make the world better! This is how bees build their hive. They link their legs together and they make a little living chain of bees. These chains of bees are called 'festoons'. And when bees are festooning like this, they're using their little bee bodies to warm up the space around them so that it's easier for them to build and repair the beeswax comb of their hive. It also makes it easier for me to scoop them up with my hands. And seeing the way that bees work together for the collective good of the colony, makes every day another great day of saving the bees! #festoon #bees #beekeeping #beekeeper #insects #bugslife #nature #animals #savethebees

	@aviationdiary_	Instagram	https://www.instagram.com/p/DF7GDeuxNp4/	The combination of the B-1 Lancer aka Bone, B-52 Stratofortress, and B-2 Spirit is often regarded as one of the deadliest bomber trios in the U.S. military arsenal because each platform brings a unique set of capabilities to the table: • B-1 Lancer: • Role: A supersonic variable-sweep wing bomber designed for speed, agility, and high payload capacity. • Capabilities: Excels in low-level penetration and rapid deployment, making it highly effective for both conventional and nuclear missions. • B-52 Stratofortress: • Role: The long-serving, heavy strategic bomber known for its durability and versatility. • Capabilities: With an enormous payload capacity and long range, it has been a backbone of the U.S. strategic bomber force since the Cold War, capable of delivering a wide array of conventional and nuclear ordnance. • B-2 Spirit: • Role: A stealth bomber engineered to penetrate sophisticated enemy defenses. • Capabilities: Its advanced low-observable design allows it to execute surprise attacks, delivering precision strikes with minimal risk of detection. Together, these bombers offer a multi-layered approach to strategic airpower: • Flexibility: They can be employed in a range of scenarios—from nuclear deterrence to conventional precision strikes. • Complementary Strengths: The speed and payload capacity of the B-1, the endurance and versatility of the B-52, and the stealth capabilities of the B-2 create a synergistic force that can adapt to evolving threats. • Global Reach: Their combined range and capabilities ensure that the U.S. can project power across the globe while maintaining strategic deterrence. This trio's ability to cover various mission profiles and operate effectively under different threat conditions is what earns them the reputation as one of the deadliest and most versatile bomber combinations in modern military history. #aviation #planespotting #avgeek #aviationlovers #fighterjet #boeing #militaryaviation #lockheed #b1 #b1lancer #b52 #b2spirit

	@baltimorebanner Video by Krishna Sharma. Footage courtesy of Martha Midgette.	Instagram	https://www.instagram.com/p/DHYbz1uKi2/	For six years, a pair of black vultures lingered around Martha Midgette's rural Southern Maryland home, tapping on the windows, snatching cat food and preening each other on the porch. "We called that pair The Old Married Couple," said Midgette, 74. Then late last month, one of the vultures arrived on the couple's porch before dawn. Midgette opened the door to see the bird collapse and die. Before she could figure out how to dispose of the dead bird — a tricky task given the bird flu epidemic — Midgette saw an unexpected sight. Another vulture awkwardly dragged the dead bird's body into the yard, a moment Midgette captured on video. Then a group of vultures gathered around the body — not to eat it, as they might do with another animal carcass — but to silently stare. Vultures, despite their reputation for being rather, well, gross, are intelligent and complex birds who form lasting relationships, said Neil Buckley, a vulture expert and chair of the biological sciences department at the State University of New York, Plattsburgh. Link in bio to read more. Reporting by Julie Scharper. Video by Krishna Sharma. Footage courtesy of Martha Midgette. #maryland #pgcountymd #vultures #birds #ecology #animals

Unlike most corals, Xenia corals rhythmically pulse their feathery polyps—opening and closing in a hypnotic dance. But why do they do it? 🌀 The Pulse Effect Unlike filter-feeding corals that rely on tentacles to catch plankton, Xenia corals use their pulsing motion to enhance gas exchange, improve photosynthesis, and possibly stir up nutrients around them. Scientists are still unraveling the exact reasons behind this unique movement! 🌱 No Stingers, Just Symbiosis Unlike stony corals that rely on stinging cells for defense, Xenia corals don't have powerful nematocysts. Instead, they thrive by rapidly growing and spreading across reef surfaces. Their polyps house symbiotic algae

	@alisonrubke	Instagram	https://www.instagram.com/p/C3RbWGdlqKZ/	🔴 DID YOU KNOW that Instagram now counts a REPLAY of your reel as an extra view? That wasn't the case last year! So if someone watches your entire reel and then replays it, you get 2 views (this is new to 2024)! Here are a few tips for how you can create re-playable reels for additional views: ⬇️ 1. Make the reel short enough (5-10 seconds) so it's quick to start re-playing. 2. A long caption will keep someone on your reel longer. Odds are, in the time it took you to read my caption, my reel played more than once! 3. LOOPING reels. These are a big trend for a reason. You want to make reels that seamlessly end the way they started so that the viewer isn't sure if they're watching one long reel or the replay. A tip for this is to find looping audio that has no clear beginning or end... typically audio without lyrics. 4. Add a surprise or quick edit that will make someone want to view the reel again to double check what they thought they saw. Maybe you've noticed your reel views are up this year as a result of this change. 😊

While Bezos's exact earnings per second can fluctuate due to changes in Amazon's stock price and his investment portfolio, various estimates provide insight into his staggering income. For instance, one analysis suggests that Bezos earns approximately \$308 per second, translating to \$18,480 per minute, \$1,108,800 per hour, \$26.6 million per day, and about \$9.7 billion annually. Another estimate indicates he makes around \$985 per second, which equates to \$59,100 per minute, \$3.5 million per hour, \$85.1 million per day, and \$595.7 million per week. These figures underscore the immense scale of wealth accumulation at the highest levels of the tech industry. #JeffBezos #Amazon #NetWorth #Billionaires #WealthInequality #IncomePerSecond #Forbes2025 #TechIndustry #WealthAccumulation — Help this information get to more voters. 🇺🇸 A well-informed electorate is a prerequisite to Democracy.—Thomas Jefferson every time you watch this, Jeff Bezos makes another \$5K #jeffbezos #amazon #employee #wealth #ceo #salary repost @dream.foramerica

As a newbie courier in NYC, my first task was to deliver a massive burger. Using the burger itself as a monowheel, I became the fastest, most unusual rider on the streets. Weaving through traffic and turning heads, I discovered that fast food could indeed involve quite the balancing act. Forget drones and robots, real delivery is when your burger arrives on its own buns. Who needs scooters and bicycles? I'm conquering these streets on my trusty burger monowheel!	
	@gaetan_nzowo_official	Instagram	https://www.instagram.com/p/C-3Ea-pJ3Uz/	Deep within Kamfundwa's mine in the Congo, men, women, and even children endure backbreaking labor in treacherous conditions—often without proper safety equipment, clean water, or fair wages. These miners risk their lives daily, extracting cobalt and copper that fuels the batteries in our smartphones and electric cars. While Western laws boast of prohibiting forced labor and unethical supply chains, the dire reality here reveals the gaps in enforcement and accountability. The international community, the US government must confront this injustice, demanding transparency and ethical practices that protect human dignity. The Section 1502 of the Dodd Frank Act aims to address the issue of mining natural resources in conditions of armed conflict and human rights abuses. Under this provision, US companies must conduct due diligence on the resource of these minerals. They are required to file reports with the US Security and Exchange Commission (SEC) to disclose whether these minerals originate from the DRC or adjoining countries, and if so, whether they are “conflict-free.” It's time to ensure that our modern conveniences are not built on the suffering of others.

	@tomcannonphotography via @oceansnation		https://www.instagram.com/p/DBJks7LPMNj/	Whale sharks dominate the feeding frenzy at the Ningaloo Reef, Western Australia. Captured by @tomcannonphotography This spectacle is a group effort—smaller predators corral the bait fish into a tight ball, setting the stage for these ocean giants to take their turn feeding.	
	@nategavin via natureismetal		https://www.instagram.com/p/DFGatLKRIZd/	This is a horsehair worm, a parasite with one of the most twisted life cycles in nature. Its story begins in water, where the adult worm lays thousands of eggs. These eggs hatch into larvae, which cling to aquatic organisms like insect larvae or snails. These intermediate hosts are crucial because they allow the parasite to get into the food chain. When an insect, such as a cricket or grasshopper, eats the infected intermediate host, the horsehair worm's larva enters its new home. Inside the insect, it sheds its protective casing and begins its real growth. Over the next several weeks or even months, the worm feeds on its host's internal fluids and tissues—but it's careful not to kill its host. Keeping the insect alive is essential for the worm to complete its life cycle. Once the worm matures, it needs to return to water to reproduce. To achieve this, it chemically manipulates the host's behavior. The infected insect becomes abnormally attracted to water—ignoring its natural survival instincts. When the insect reaches water, it often jumps in or falls in, giving the worm the opportunity to emerge. The host usually drowns or dies shortly after, as its body has been hollowed out and weakened by the parasite. After emerging, the adult worm swims freely in the water, seeking a mate to restart the cycle. It lays its eggs, and the process begins all over again. It's a grimly efficient life cycle that's designed to use multiple hosts and exploit their behaviors, ensuring the worm gets exactly where it needs to go. 👤 by @nategavin

	@owen_reiser via nature is metal	Instagram	https://www.instagram.com/p/DI9gJDFRNqQ/	The Way of All Flesh 👤 by @owen_reiser This 5 day visual journey chronicles the progressive stages of decay observed in a deer fawn. The fawn died when it was struck by a vehicle. During the first hours after death, the cells within the young deer's body release enzymes that break down the cells themselves. This process leads to the rupture of cell membranes and the release of internal fluids. Simultaneously, the body stiffens due to a halt in the production of a molecule known as ATP, which is responsible for providing energy for muscle contractions, among its various functions. The next stage is bloating. Bacteria in the gut, thriving and rapidly digesting the fawn's body from the inside, carry out this process for roughly 48 to 72 hours. As they break down tissues and cells, they produce gases such as methane, carbon dioxide, and hydrogen sulfide, causing the body to swell and expand. The subsequent stage in this active decay is when the gases begin to escape, often leading to the rupture of the body cavity. This rupture exposes the body's internal organs and fluids to the environment, attracting a wide variety of insects, particularly flies. Flies lay eggs on the carcass, and these eggs hatch into larvae (maggots) which begin to feed on the decaying flesh. The activity of these insects accelerates the breakdown of tissues. After about five days, the body continues to decay. The maggots persist in feeding and growing, and eventually, they leave the carcass to pupate and mature into adult flies. Simultaneously, other scavengers, such as vultures, raccoons, or even other deer, may come to feed on the carcass. The bones and remaining tissues will gradually be broken down by bacteria, fungi, and other decomposers, until eventually all that's left is the skeleton. Over time, even the bones will decay and return to the environment ----- ----- Nature Is Metal is powered by you!
