

MUTATIONS

In year 2051, the scientist Lorna Rain had made many attempts to achieve a mutation in ants. In these attempts, all the subjects (the ants) had suffered all kinds of side effects, changes in growth, color change and death. Dr. Rain wanted to try the experiment one last time before concluding it in complete failure. He found another doctor specialized in mutations and they decided to combine the DNA of ants with that of humans. They went to the Antarctic area, to a land that no country had claimed. They had the necessary technology to be able to carry out their investigations and soldiers to take care of their safety since it was a secret project and they did not want to draw the world's attention.

A year passed...
