

How can technology help give a voice to some learners?

I think technology is the only tool where we can truly give our young people a voice without adult interpretation. So if we didn't have that technology, it would be taking their voice away from them. It's very easy for a child with complex, profound disabilities to have that assumption that actually they can't contribute and they can't interact and participate in society. But actually, what we find is technology gives those children that voice to showcase what they can do, and actually they can educate others on SEND reform and what it means to be a young person with SEND.

I was a tired boy when I got home from school.

You were tired?

It must have been all that partying at the weekend.

Oh, yeah, you had a party at the weekend, didn't you? You went to Emily's party at the weekend. You were dressed as Maui. You had all fake tattoos and everything, didn't you?
