

Charles Babbage Analytical Engine

In this article I am going to talk about Charles Babbage Analytical Engine. I'm going to give information about its this engines history and what it is used for.

The Analytical Engine was the worlds first general-purpose computer. It was designed by Charles Babbage, an English Mathematician in the 1830s. It was finally constructed in the year 1991 because the government hadn't supported it enough to pay for it earlier. The main contribution to the Computer System is that it had a store and a mill. Also an analogous to today's memory and processor. This engine is aimed to be classified under Input Devices and Output Devices.
