# How to onboard Integra with Unloc

# Onboarding Integra solution

In order for us to integrate with a new installation, there are some components and requirements that must be present.

This section describes these requirements.

## Requirements

The customer must have a running Integra server with a plugin called ICEAlarm, which enables third parties (like Unloc) to connect to the server. System House can probably help verify, or help with the installation of this. Also, the Integra server must be configured to allow Web Socket Transportation for the Signal server.

## Information the customer must provide

They must provide us the following information about the Integra server in order for us to connect to the server.

| Name | Description | Example |
|---|---|---|
| **Username** | The username of the account. | ECA |
| **Password** | The password of the account | 1234567 |
| **URL to login server URL** | URL to the login server. | https://integrationtest03.iecalarm.bravidacloud.se/api/login/login |
| **URL to SignalR server** | URL to the SignalR server | https://integrationtest03.iecalarm.bravidacloud.se/signalr |
