

CRITICAL INCIDENT STRESS INFORMATION SHEETS

You have experienced a traumatic event or a critical incident (any incident that causes emergency service personnel to experience unusually strong emotional reactions which have the potential to interfere with their ability to function either at the scene or later). Even though the event may be over, you may now be experiencing or may experience later, some strong emotional or physical reactions. It is very common, in fact quite *normal*, for people to experience emotional aftershocks when they have passed through a horrible event.

Sometimes the emotional aftershocks (or stress reactions) appear immediately after the traumatic event. Sometimes they may appear a few hours or a few days later. And, in some cases, weeks or months may pass before the stress reactions appear.

The signs and symptoms of a stress reaction may last a few days, a few weeks or a few months and occasionally longer depending on the severity of the traumatic event. With understanding and the support of loved ones the stress reactions usually pass more quickly. Occasionally, the traumatic event is so painful that professional assistance from a counselor may be necessary. This does not imply craziness or weakness. It simply indicates that the particular event was just too powerful for the person to manage by themselves.

Here are some common signs and signals of a stress reaction:

<i>Physical*</i>	<i>Cognitive</i>	<i>Emotional</i>	<i>Behavioral</i>
chills	confusion	fear	withdrawal
thirst	nightmares	guilt	antisocial acts
fatigue	uncertainty	grief	inability to rest
nausea	hypervigilance	panic	intensified pacing
fainting	suspiciousness	denial	erratic movements
twitches	intrusive images	anxiety	change in social activity
vomiting	blaming someone	agitation	change in speech patterns
dizziness	poor problem solving	irritability	loss or increase of appetite
weakness	poor abstract thinking	depression	hyperalert to environment
chest pain	poor attention/ decisions	intense anger	increased alcohol consumption
headaches	poor concentration/memory	apprehension	change in usual communications
elevated BP	disorientation of time, place or person	emotional shock	etc...
rapid heart rate	difficulty identifying objects or people	emotional outbursts	
muscle tremors	heightened or lowered alertness	feeling overwhelmed	
shock symptoms	increased or decreased awareness of surroundings	loss of emotional control	
grinding of teeth	etc...	inappropriate emotional response	
visual difficulties		etc...	
profuse sweating			
difficulty breathing			
etc...			

Any of these symptoms may indicate the need for medical evaluation.

When in doubt, contact a physician.
