KEEP LOOKING UP

Your Newest Astronomy News

We are quickly approaching the end of the first quarter, fellow Stargazers. However, that has not slowed us down in Astronomy. This week we took a look at why the Earth appears blue, both from space as well as from our own frame of reference. We examined how different light Spectra can influence cosmic events such as the full moon that took place last week. We examined how changing angles, particulates in the atmosphere and other variables can actually alter the way we see things in the sky. Pictured below is the 7B class performing a lab/demo on the subject. Finally, check out the beautiful pictures of the Moon that Heaven A. (top) and Caroline C. (bottom) captured Friday, September 25. Keep Looking Up!
