

browser based word processor and spinoffs use a generic tab icon unless you add a version of the following code to the head area in the html files (viewable in box1 tab or a text editor but not in default):

```
<link rel="shortcut icon" type="image/x-icon" href="/favicon.ico">  
<link rel="shortcut icon" type="image/x-icon" href="file:///c:/mc/bwp1/()/[cus].ico">
```

adjust to suit your choices and paths/addresses.

jpegs and pngs converted with:

<https://www.convertico.com/>

while in the head area, you can change the name of the tab by swapping out the text between the `<title>tags</title>`
(above example would give you a tab that's named "tags" regardless of the name you saved the file under.)

edit 2/20: the ico format apparently also works in .desktop files and with rox's right click file association function (tested in bionic64)
