ABSTRACT

The abstract should systematically present the study's objectives, methodology, novelty, findings, conclusions, and policy recommendations. The abstract should be written as a single paragraph of continuous sentences (not equations or formulas), without subheadings, footnotes, or references, and should reflect the essence of the entire manuscript. The length should range between 150-250 words (use 1.0 space and font size 10).

INTRODUCTION

This journal welcomes high-quality research and development manuscripts from diverse disciplines, including but not limited to education, social sciences, natural sciences, technology, and the arts. Submissions may explore theoretical, empirical, or practical issues, including the formulation, analysis, and evaluation of policies, practices, and innovations across various fields.

All manuscripts must be written in English and adhere to international academic standards. Authors are expected to use proper grammar, punctuation, and spelling, and to follow conventions for clear and professional scholarly writing.

Manuscripts should be typed with **1.15 line spacing on A4-size paper**, using **Segoe Fluent Icons font size 12**, and contain maximum 8,000 words. Manuscripts must be submitted in Microsoft Word format (.doc or .docx).The manuscript should be original, unpublished, not under consideration elsewhere, and free of plagiarism.

The Introduction presents the background and context of the study, situating it within the relevant field(s). It should include a review of the literature, highlighting the existing discourse and identifying the research gap and the study's novelty. Authors are encouraged to use recent references from nationally or internationally recognized journals (ideally published within the last 10 years) to support the identification of the gap and novelty. Classic references (older than 10 years) may be included if relevant, but should generally comprise no more than 20% of the total references. The Introduction should also

state the problem, research objectives, significance of the study, and expected outcomes. This section is recommended to account for approximately 25% of the total manuscript length.

RESEARCH METHODS

This section explains the methods used in conducting the research. It is recommended to begin with the research approach, variables used, data sources, population, informants/respondents as the sample, research period, research location, and a rationale for selecting each element. This section should also explain the techniques of data collection, processing, and analysis, as well as the limitations of the study. This section should comprise approximately **10%** of the manuscript length.

RESEARCH FINDINGS

This section contains research findings based on the research objectives and the interpretation of these findings. This section also contains the presentation of relevant research results. If the research has more than one objective, the results should be presented consistently according to each research question and objective.

The data may be presented using relevant tables, graphs, or qualitative excerpts (e.g., interviews, FGDs, observations, or document analysis). This section is about **20%** of the manuscript's length.

Table 1 The Table Title is Written Above the Table

Section	Length*
1. Introduction	25%
2. Research Methods	10%
3. Research Findings	30%
4. Discussion	20%
5. Conclusion and Policy Recommendations	15%

* Percentage of total manuscript length
Source: Data Source, year of publication
(*Source is listed in the reference list*)

Text within tables or graphs should be in the same language as the manuscript. Tables should be editable and not inserted as images, and should use only horizontal lines at the top and bottom, without vertical borders. Descriptive paragraphs should analyze the table content rather than merely repeating it.

DISCUSSION

The research findings are discussed, analyzed, elaborated, and interpreted to achieve the research objectives and address the research problems. The discussion should also connect the research findings with relevant theories and references. If the research has more than one objective, the results should be presented consistently according to each research question and objective. This section is about **30%** of the manuscript's length.

CONCLUSION AND RECOMMENDATIONS

The Conclusion should provide clear answers to the research objectives, derived from the findings and discussion, and remain consistent with the research problems and objectives. It is not merely a summary of the results.

The Recommendations should be based on the research findings and conclusions and aim to provide practical, actionable guidance relevant to stakeholders, practitioners, or policymakers in the field. Recommendations should be operational, logical, and applicable, rather than normative. They may include suggested actions, responsible actors or institutions, and supporting justifications.

Both the conclusion and recommendations should be written as coherent narratives in separate paragraphs, rather than as numbered lists or bullet points. This section is recommended to account for approximately 15% of the total manuscript length.

ACKNOWLEDGMENT

Acknowledgments are optional. However, research manuscripts funded or sponsored by a particular party must include a statement acknowledging the sponsor and expressing gratitude for their support.

Acknowledgments may also be given to other individuals or institutions that directly contributed to the writing of the article.

REFERENCE LIST

The reference list must follow the international standard of the American Psychological Association (APA) Style, 7th edition, using the Mendeley application.

There must be at least 15 references from both primary and secondary sources. Primary sources refer to accredited or reputable national and international journals. All references must be from publications issued within the past 10 years. Classic references (published more than 10 years ago) may be used if relevant to the study, but must not exceed 20% of the total references.

All cited references or source materials must be included in the reference list. Conversely, references or materials not cited in the manuscript should not appear in the reference list.
