

Đề bài: The charts show the main methods of transport of people traveling to one university in 2004 and 2009. Summarize the information by selecting and reporting the main features, and make comparisons where relevant.

Mẫu bài pie chart tiêu biểu về việc sử dụng phương tiện giao thông

Bài tham khảo:

The given pie charts compare the percentage of students using five different means of transportation (Car, Train, Bus, Bicycle, and Walking) to travel to a particular university during 2004 and 2009.

It is noticeable that traveling by train was the least favored form of transportation, while there was a change, from cars to buses, for the most commonly used form of transport over the five year period.

In 2004, just over half of students traveled to the university by car, with only a third taking a bus. The remaining students rode a bike, went on foot or took a train, with the figures being 9%, 4%, and 3% respectively.

However, with the construction of a new bus stop in 2008 and the introduction of car parking fees in 2006, in 2009 the number of students commuting by car dropped to 28%, and consequently the number of students traveling by all other methods increased. Those traveling by bus increased to 46%, bicycle user's rose to 16%, and both train travelers and walkers increased by 1% and 2% respectively.
