

The Electronic World Around Us

Electronics are everyday used items which almost all people have. The things that you used in the phones, laptops, iPads, etc., are all made with batteries and chips. To explain electronics as your body your brain is main chip, your nerves are wires, your eyes as cameras and your heart plus your stomach as battery. If you want a simple wiring setup connect a motor to a switch then a battery to the motor this is your first thing that you did with electronics. Electronics are the most used things for entertainment in the world. Mainly in a phone the first thing that they make is the phone frame after that they make the screen which matters on the resolution and the frames per second, then they connect that to the rest of the stuff in the phone and the same works with every other electronic device. For a tv remote it works different there is an ir chip in the tv which connects to the screen and the mother board the positive and the negative and the signal connects to the mother board. The tv remote is different with all the different buttons so it has different features based on brand. For a speaker there is a supersonic sound that gets converted so you can hear it. All in all these are the common basics about electronics.
