

# Modular Character Plugin Documentation

Welcome to the documentation for the Modular Character Plugin for Unreal Engine. This plugin empowers developers to create modular characters easily, offering a range of features such as dynamic character construction, persistent character skin data transfer across levels, and a runtime character customization environment.

## F.A.Q :

### **My character does not show up hence i set up my character:**

Ensure your character parts have at least one material.

### **All of my character parts are flickering when i move the camera:**

Ensure your meshes have a physic asset assigned.

## **Update Notice v1.2:**

- Added support for copy pose mesh; `bConfigureForCopyPose`
- Added `bConfigureForMasterPose` as option; in previous versions this option was default behavior except the case that `bUseAnimationsPerInstance` option enabled
- `bUseAnimationsPerInstance` has been removed (since you disabled `bConfigureForMasterPose` and `bConfigureForMasterPose` this is exact behavior of the plugin )

## **Update Notice v1.1:**

Added Support for [ALS-Refactored](#) Plugins Default Blueprint Character:

- For using with ALS character structure close disable all checkbox except "bForceNameMatchWithComponent"
- Define CharacterParts with respect to your modular components.
- Add Skeletal Mesh Components (Component Names must be exact with each related CharacterPart)

## 1. Introduction

### Plugin Overview

The Modular Character Plugin is a powerful tool for Unreal Engine developers looking to create modular characters with ease. Whether you're building a game with customizable characters, need dynamic character construction, or want to transfer character skin data across levels, this plugin has you covered.

## 2. Key Features

**Dynamic Character Construction:** Automatically create and manage skeletal mesh components for character parts.

**Persistent Character Skin Data:** Transfer character skin data across levels for a consistent character appearance.

Runtime Character Customization: Enable players to customize characters during gameplay.  
Data Table Integration: Define character construction information using Unreal Engine data tables.

### 3. Getting Started

Before diving into the details, make sure to install the plugin correctly. Once installed, you can start using it in your Unreal Engine project.

### 4. Configuring Properties

Configure the plugin's properties to define your character's behavior and appearance. Key properties include:

**bSelectBestOptionsForMe:** Automatically selects the best construction options at runtime.

**bAutoCreateSkeletalMeshes:** Automatically creates skeletal mesh components.

**bUseParentSkeletalMeshAsRoot:** Sets the parental skeletal mesh as the root.

**CharacterAnimClass:** Define the animation blueprint for the character.

**ConstructionTable:** Use a data table to define character construction information.

**bUseAnimationsPerInstance:** Assigns animation blueprint for every part of character instead of just leader part

### 5. Runtime Character Customization

Enable players to customize characters during gameplay using the provided functions. This allows for dynamic character appearance changes based on player input.

### 6. API Reference

UModularCharacterComponent Class

Refer to the UModularCharacterComponent Class for an in-depth look at the class's properties and methods. This is essential for advanced usage and understanding the component's capabilities.

### 7. Example Videos

[Video 1: Basic Setup](#)

[Video 2: Replication](#)

[Video 3: Persistent Data](#)

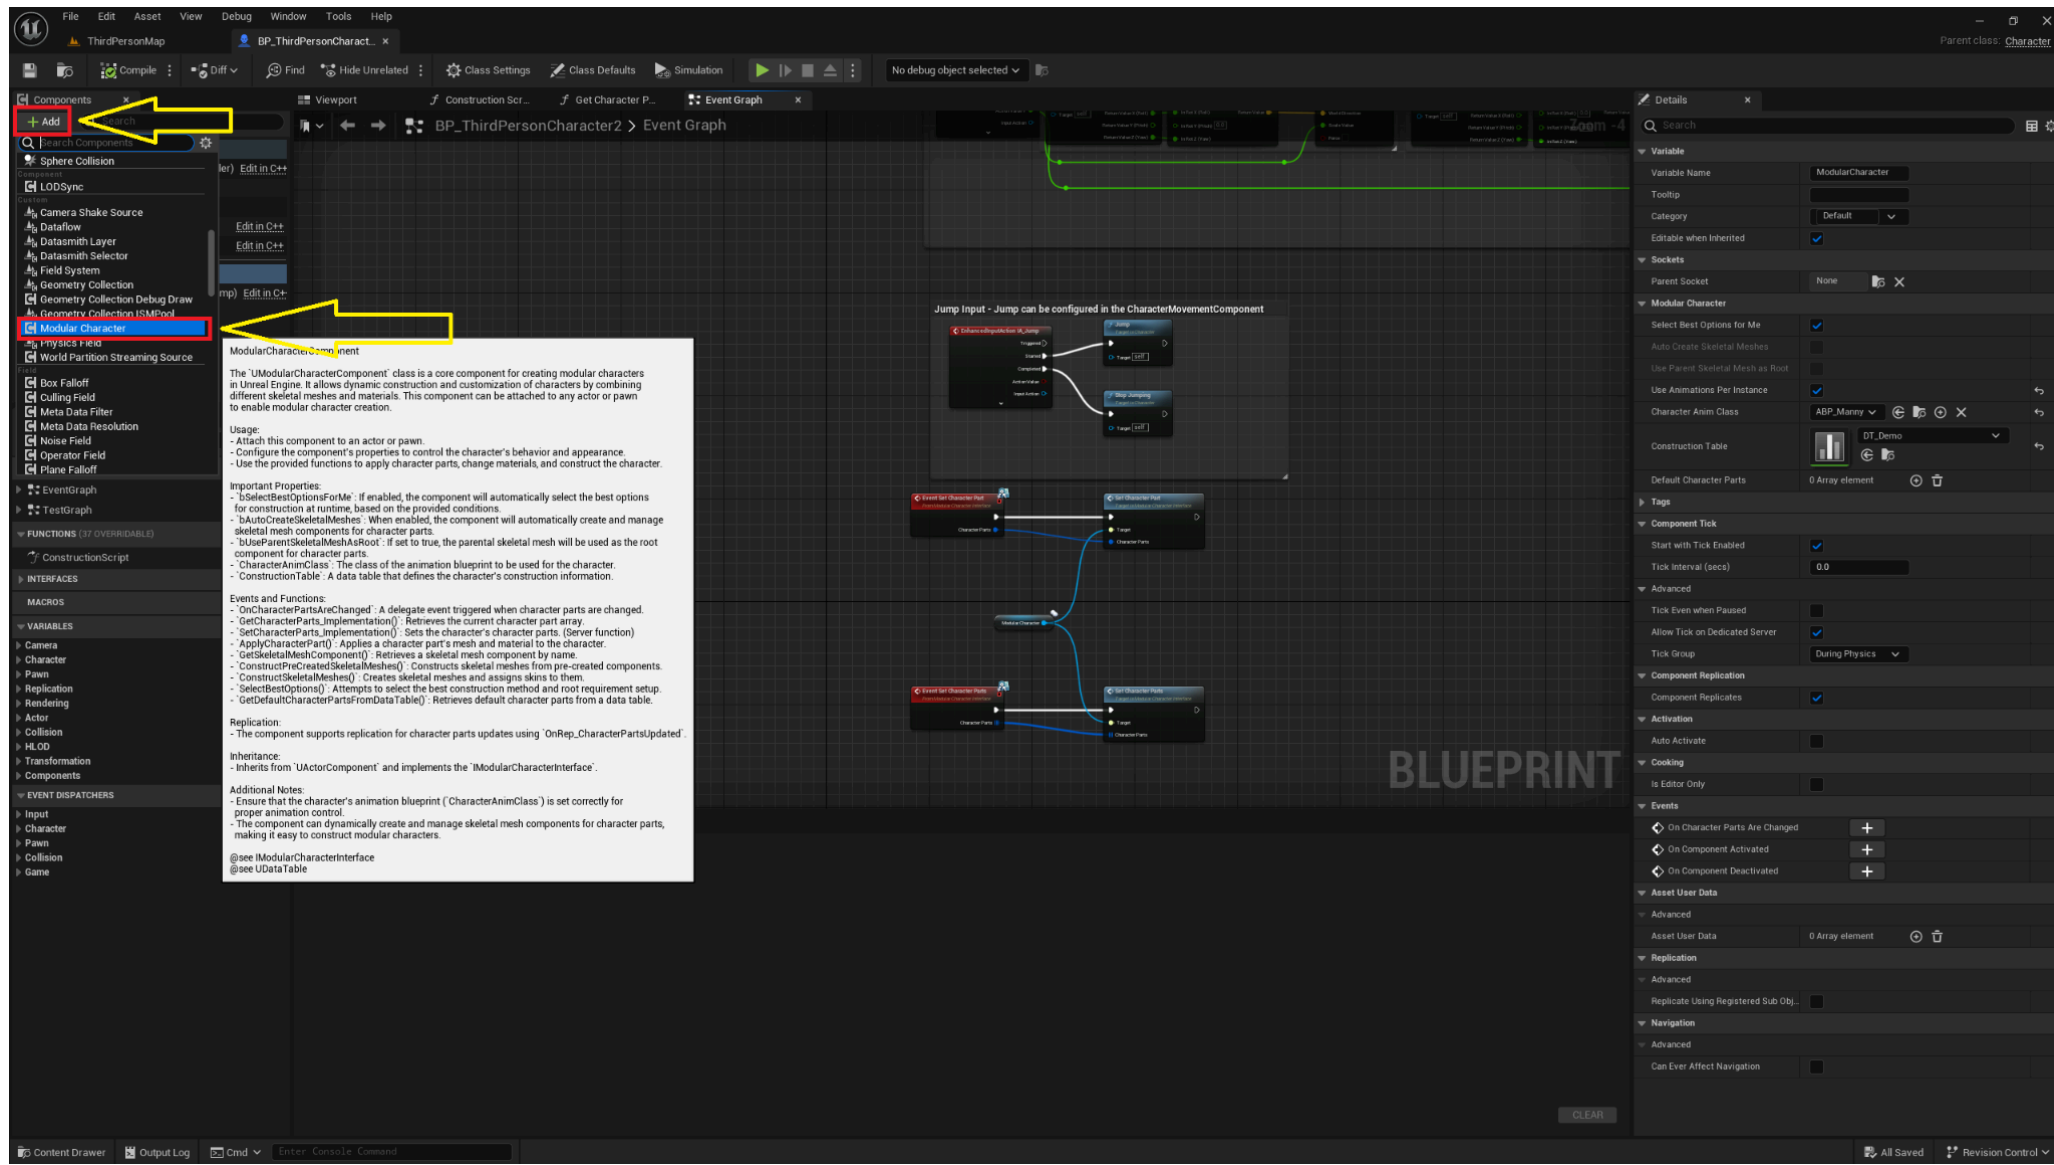

[Video 4: Listen Server Support](#)

[Video 5: Gender Change To The Different Skeleton](#)

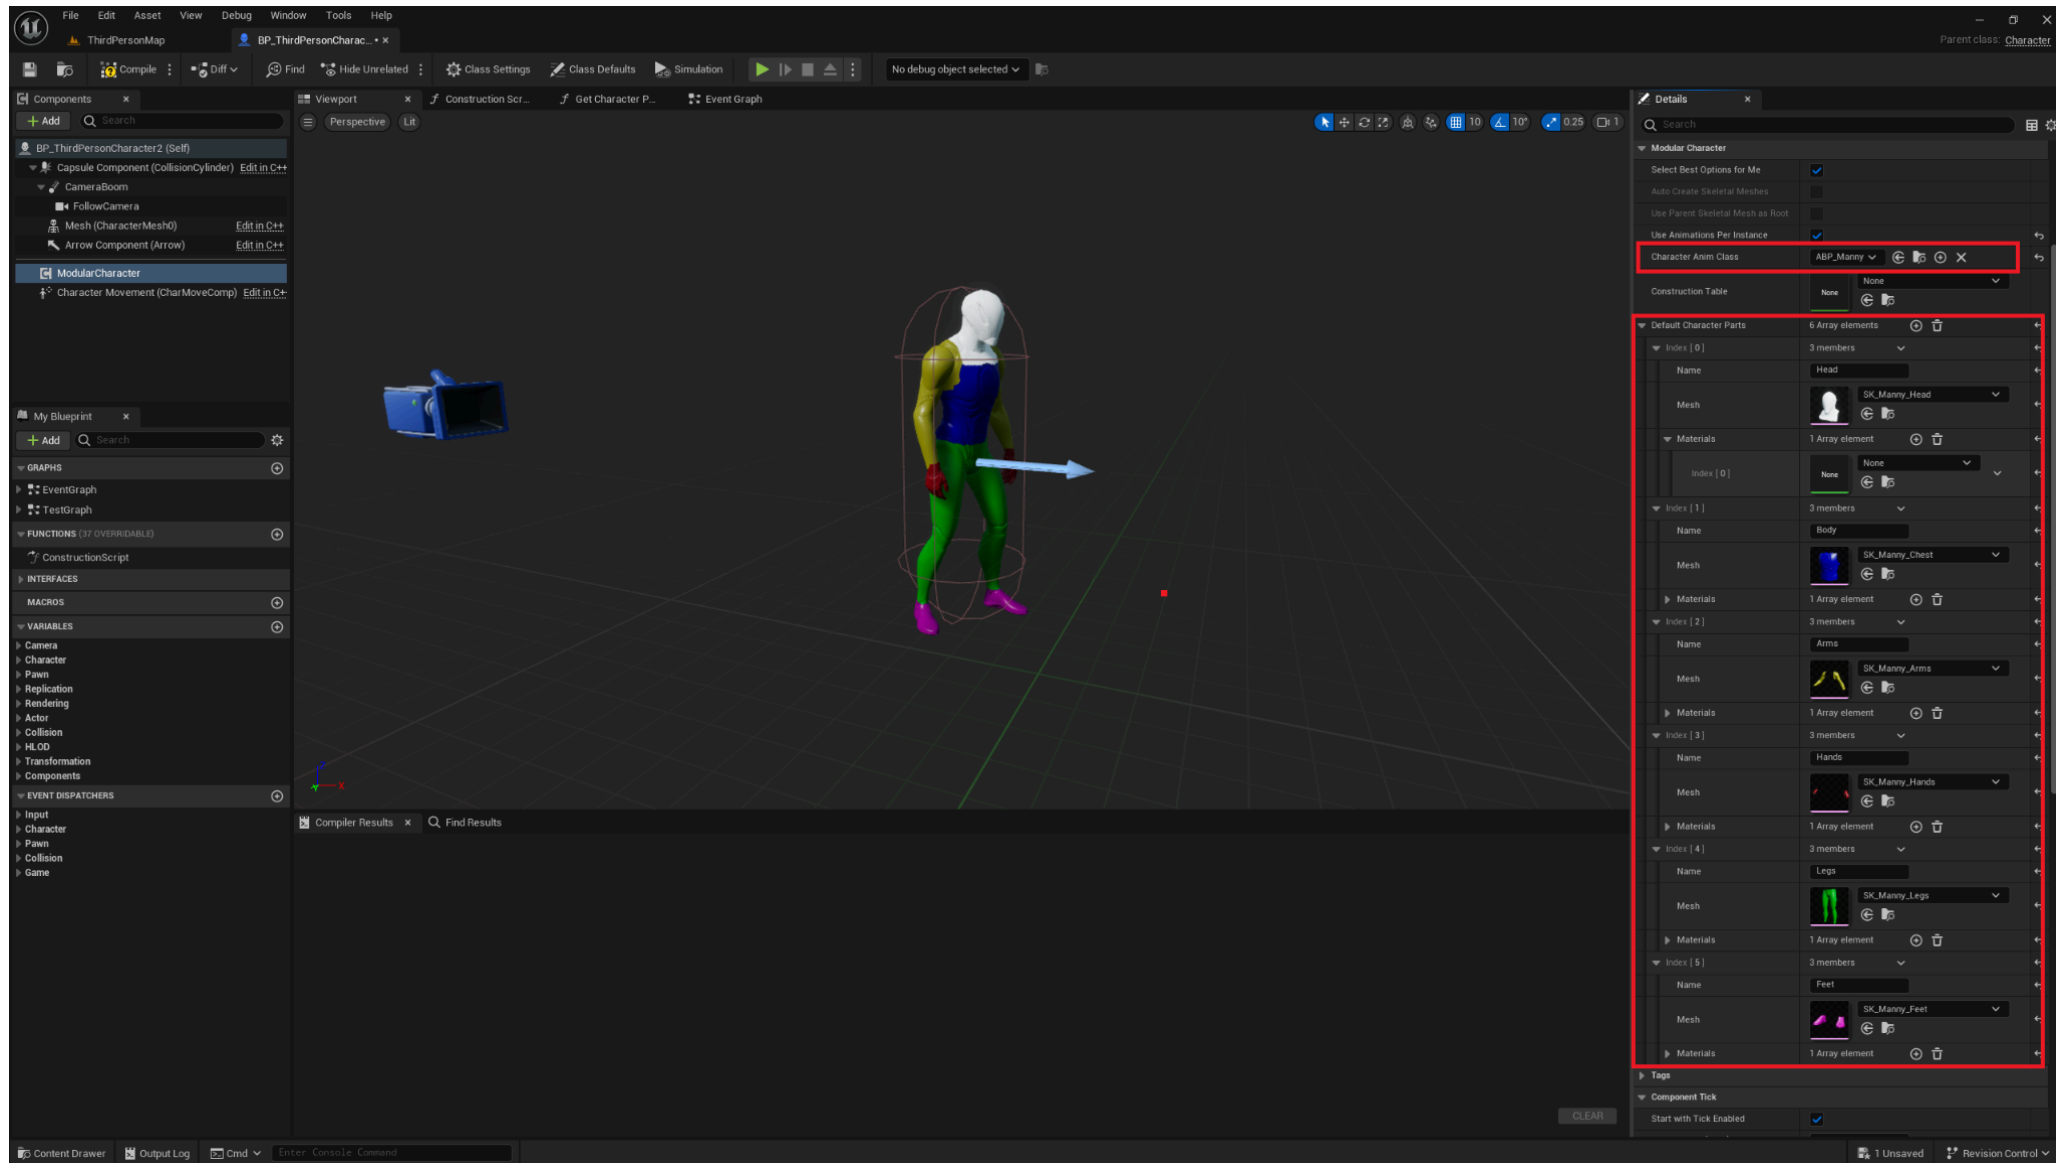

[Video 6: Performance Comparison Between Conventional Method](#)

# BASIC USAGE [VIDEO]

1. Add a modular character component to a character blueprint

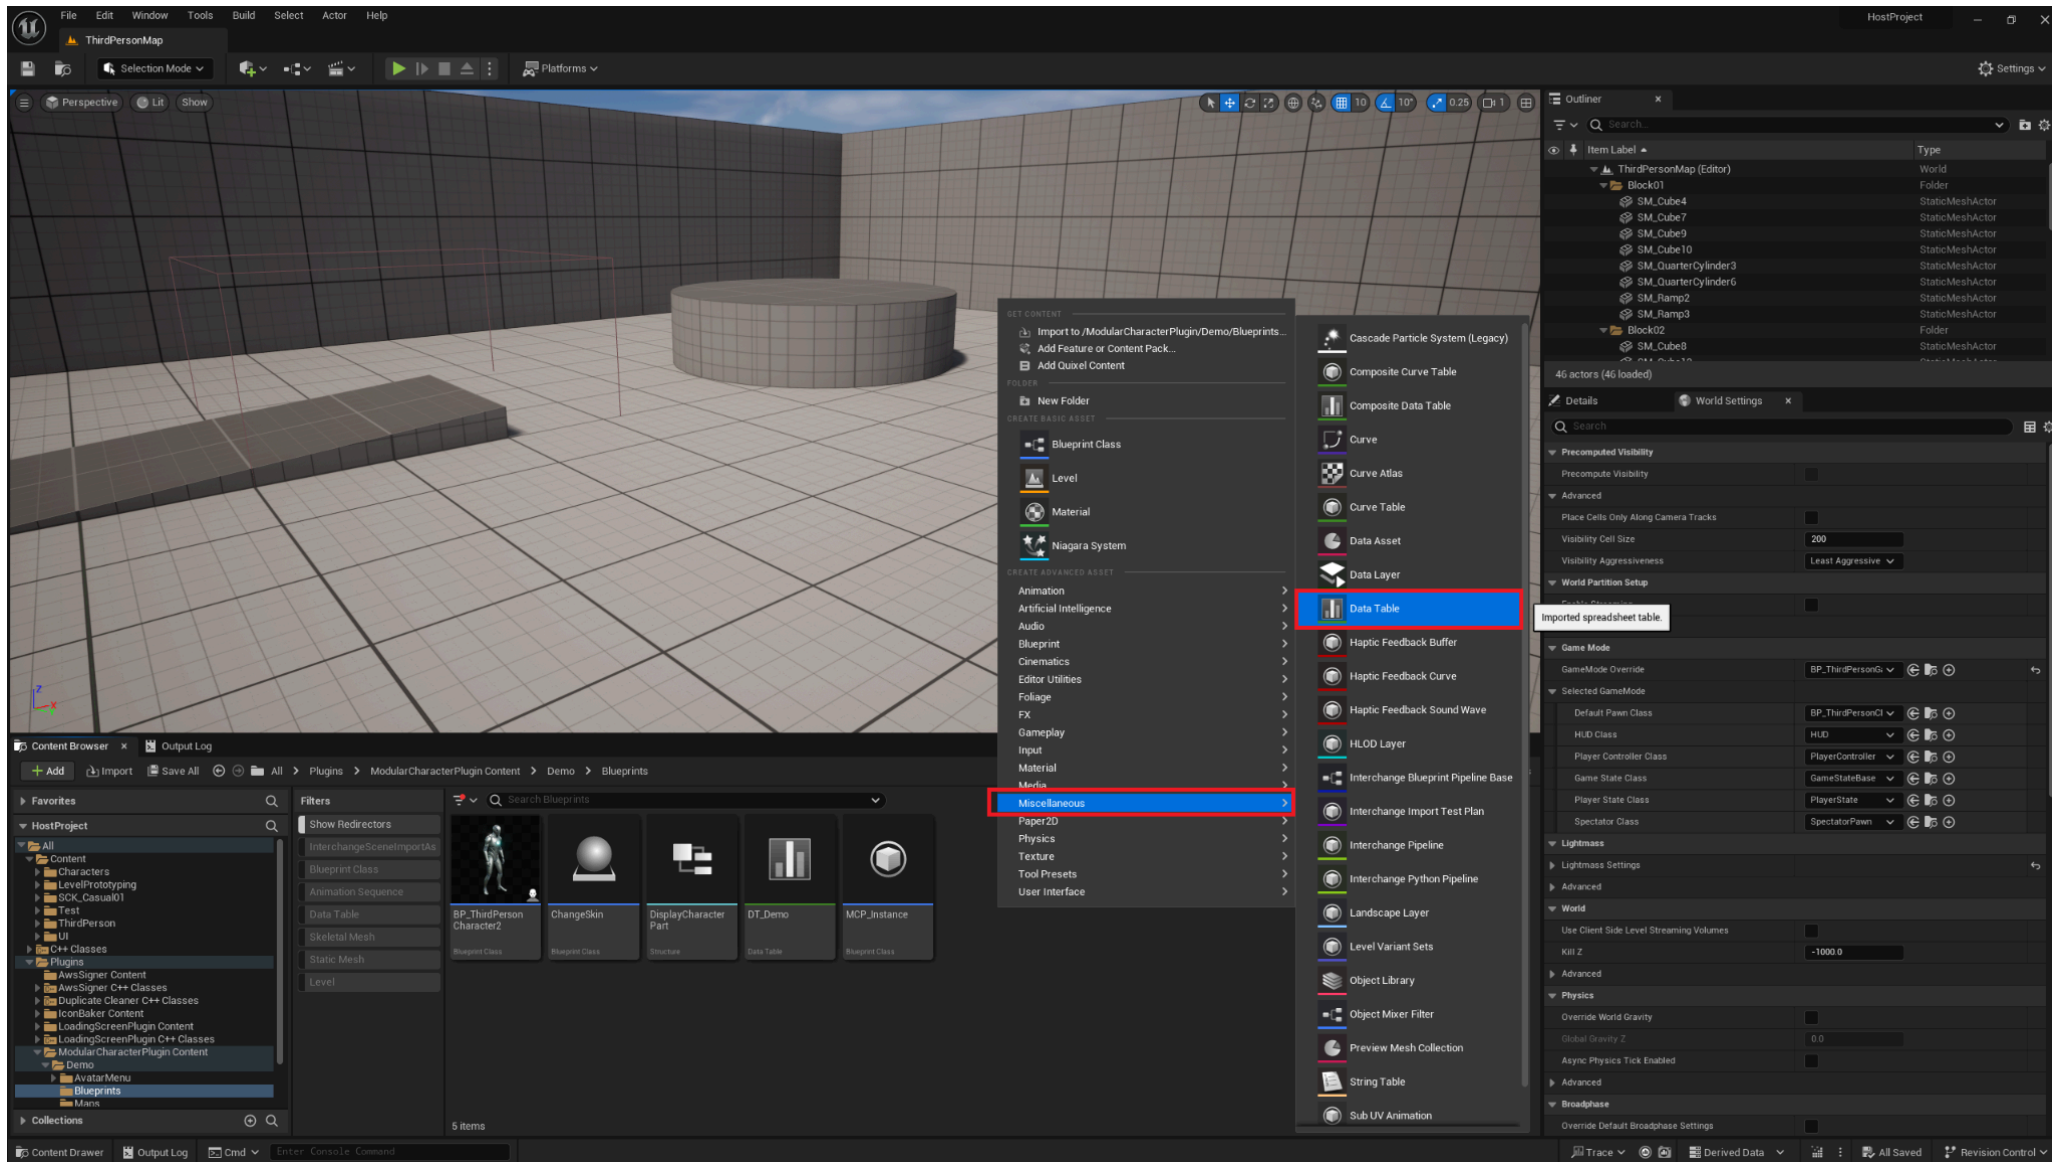

2. Select Animation class
3. Select initial meshes(each skeleton type has a unique name)
4. Each mesh has a material even if its empty

# Using With Datatables

1. Create a data table from DisplayCharacterPart structure, You can use another custom structure if it has a property populated from FCharacterPart.(Not direct FCharacterPart tables are supported)

Add your character parts to the table, parts with the same types can change during runtime. But for initialization first occurred instance of a part will be used.

The screenshot displays the Unreal Engine 5.3 interface. At the top, the 'Data Table' editor is open, showing a table with columns 'Row Name', 'Image', and 'DisplayText Part'. The table contains six rows, each representing a different body part of a character. The 'Add' button in the top toolbar is highlighted with a red box.

Below the table, the 'Row Editor' is open for the 'Head0' row. It shows the 'Image' field set to '127grey' and the 'DisplayText' field set to 'Head'. The 'Part' section is expanded, showing the 'Name' field set to 'SK\_Manny\_Head'. The 'Mesh' field is set to 'None', and the 'Materials' field is set to 'None'. A red box highlights the 'Mesh' and 'Materials' fields, with a yellow arrow pointing to them from the text 'Mesh and Type types must be unique among each skeletal'.

Another red box highlights the 'Image' field, with a yellow arrow pointing to it from the text 'Inventory Display Image'.

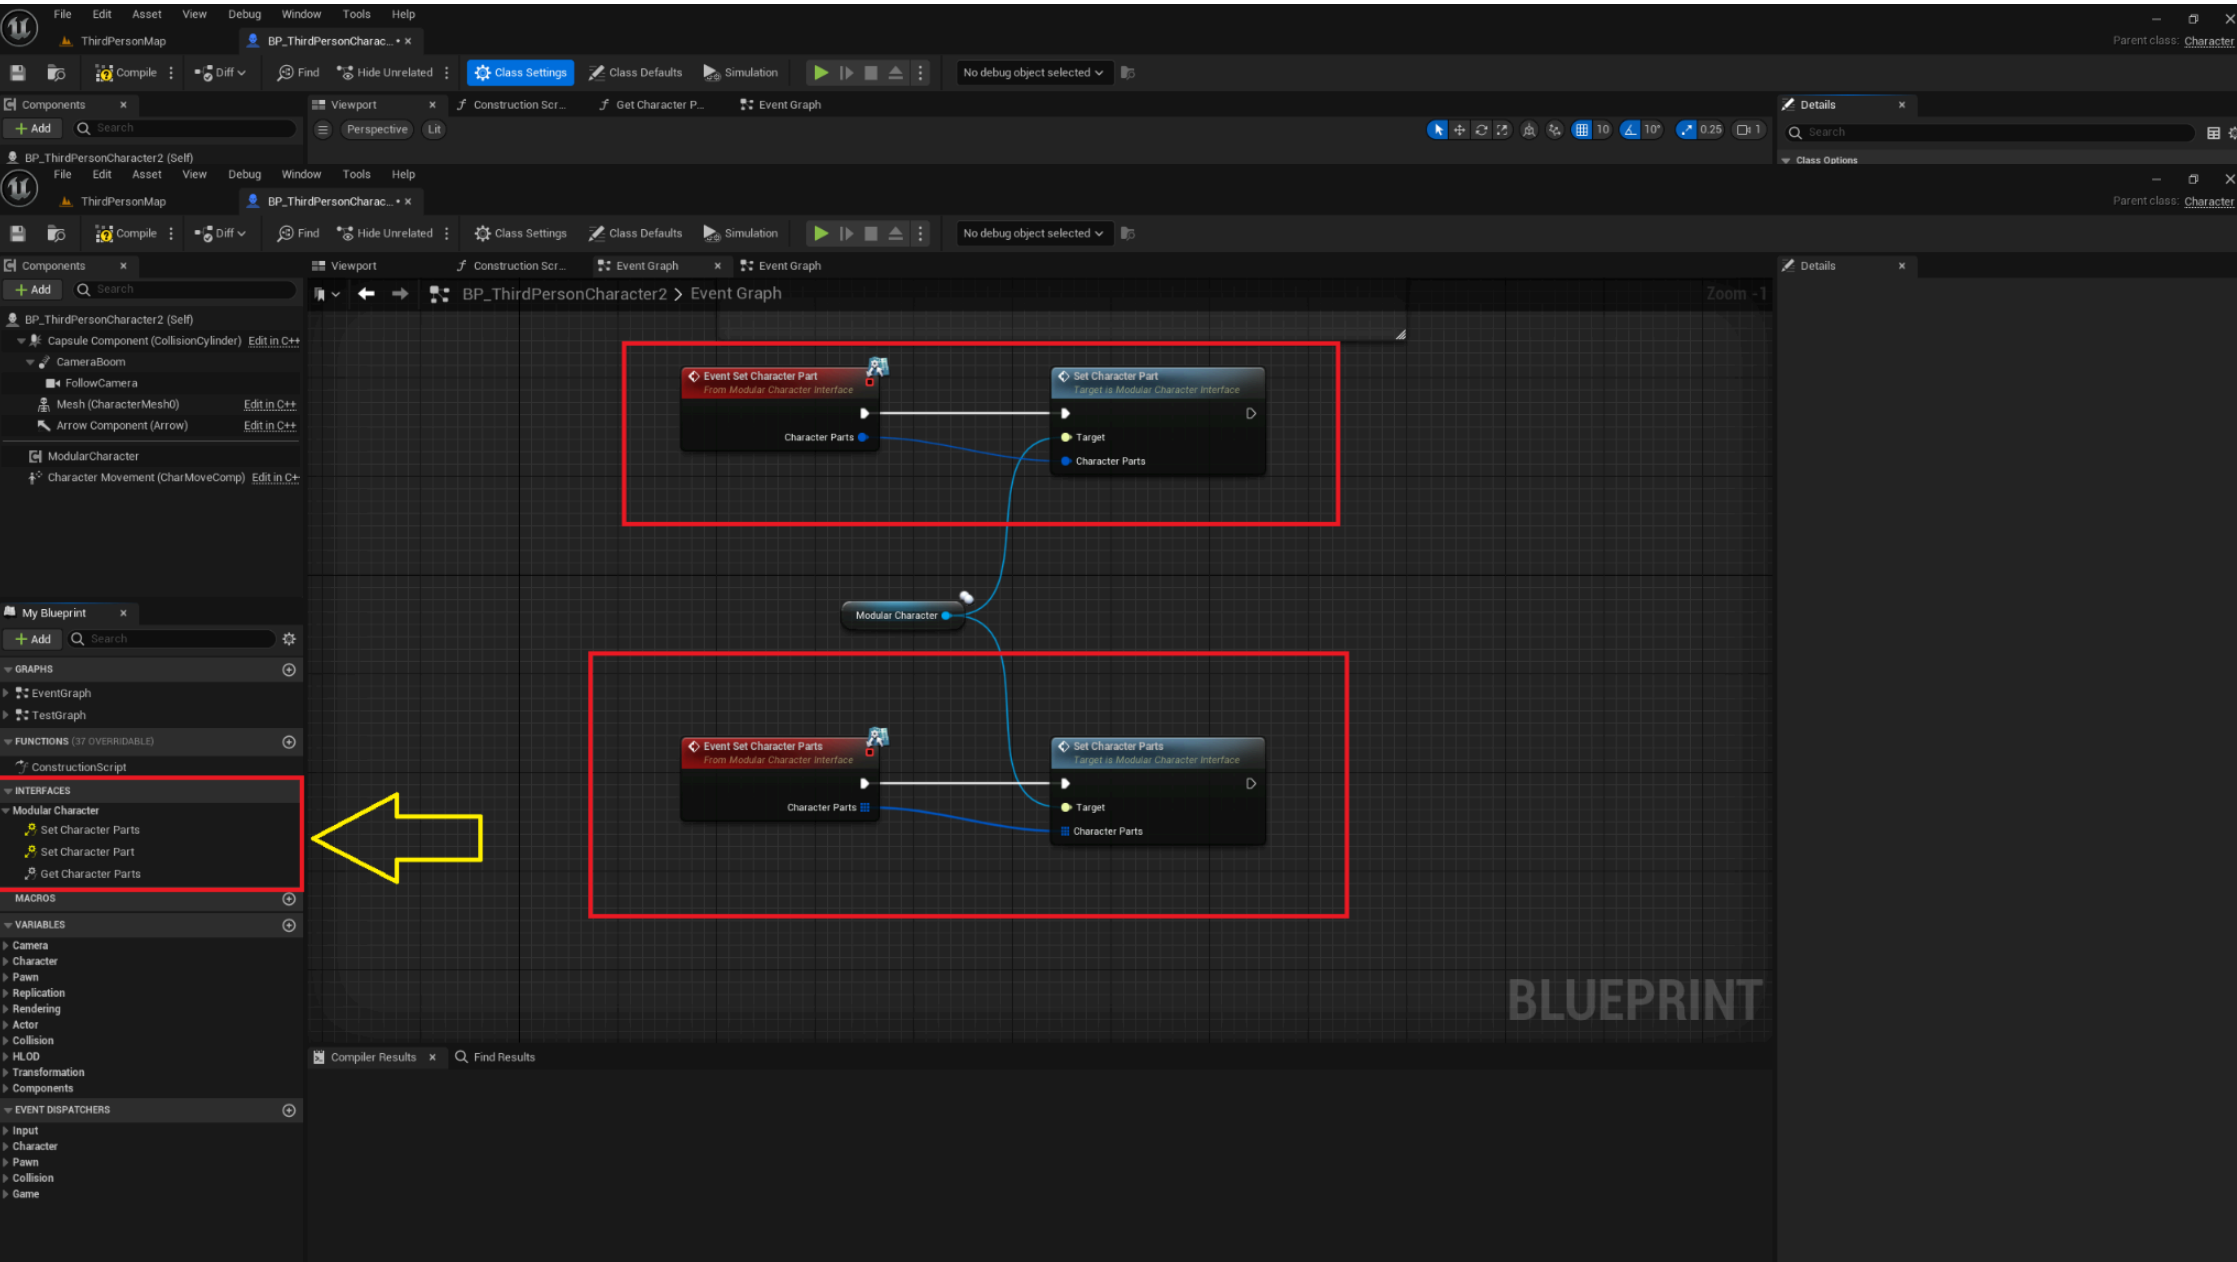

A third red box highlights the 'Materials' field, with a yellow arrow pointing to it from the text 'Each mesh has at least one material even its empty'.

Row Name	Image	DisplayText Part
1 Head0	/Engine/ArtTools/RenderToTexture/Textures/127grey	{ "Name": "Head", "Mesh": "/ModularCharacterPlugin/Demo/UE5_Manny/Manny/Body_parts/SK_Manny_Head", "Materials": [ "None" ] }
2 Body0	None	{ "Name": "Body", "Mesh": "/ModularCharacterPlugin/Demo/UE5_Manny/Manny/Body_parts/SK_Manny_Chest", "Materials": [ "None" ] }
3 Legs0	None	{ "Name": "Legs", "Mesh": "/ModularCharacterPlugin/Demo/UE5_Manny/Manny/Body_parts/SK_Manny_Legs", "Materials": [ "None" ] }
4 Hands0	None	{ "Name": "Hands", "Mesh": "/ModularCharacterPlugin/Demo/UE5_Manny/Manny/Body_parts/SK_Manny_Hands", "Materials": [ "None" ] }
5 Feet0	None	{ "Name": "Feet", "Mesh": "/ModularCharacterPlugin/Demo/UE5_Manny/Manny/Body_parts/SK_Manny_Feet", "Materials": [ "None" ] }
6 Arms0	None	{ "Name": "Arms", "Mesh": "/ModularCharacterPlugin/Demo/UE5_Manny/Manny/Body_parts/SK_Manny_Arms", "Materials": [ "None" ] }

Create a actor for manipulate character, in this example basic actor used, with Boxtrigger

The screenshot displays the Unreal Engine 4 Blueprint Editor interface. The main workspace shows an Event Graph for a Blueprint Class named 'ChangeSkin'. The graph is titled 'ChangeSkin > Event Graph'. A red box highlights a sequence of three nodes: 'On Component Begin Overlap (Box)', 'Get Data Table Row DT\_Demo', and 'Set Character Part'. The 'On Component Begin Overlap (Box)' node has inputs for 'Overlapped Component', 'Other Actor', 'Other Comp', 'Other Body Index', 'From Sweep', and 'Sweep Result'. The 'Get Data Table Row DT\_Demo' node has a 'Data Table' input set to 'DT\_Demo' and a 'Row Name' input set to 'Arms0'. It has outputs for 'Row Found', 'Row Not Found', 'Out Row Image', 'Out Row Display Text', and 'Out Row Part'. The 'Set Character Part' node has a 'Target' input set to 'Target' and a 'Character Parts' input set to 'Character Parts'. A tooltip above the 'Event Tick' node states: 'This node is disabled and will not be called. Drag off pins to build functionality.' The right-hand side of the interface shows the 'Details' panel for the 'Actor' class, with various settings like 'Replication', 'Actor Tick', 'Rendering', 'Collision', 'HLOD', 'Input', 'Physics', and 'World Partition' visible. The bottom status bar shows 'All Saved' and 'Revision Control'.

Blueprint Editor Interface showing the Event Graph for the 'ChangeSkin' actor. The graph is titled 'ChangeSkin > Event Graph'.

The graph contains the following nodes and connections:

- On Component Begin Overlap (Box)** (Trigger Node) is connected to **Get Data Table Row DT\_Demo** (Function Node).
- Get Data Table Row DT\_Demo** (Function Node) is connected to **Set Character Part** (Function Node).

The **On Component Begin Overlap (Box)** node has the following inputs:

- Overlapped Component
- Other Actor
- Other Comp
- Other Body Index
- From Sweep
- Sweep Result

The **Get Data Table Row DT\_Demo** node has the following inputs and outputs:

- Input: Data Table (DT\_Demo)
- Input: Row Name (Arms0)
- Output: Row Found
- Output: Row Not Found
- Output: Out Row Image
- Output: Out Row Display Text
- Output: Out Row Part

The **Set Character Part** node has the following inputs:

- Target
- Character Parts

A red box highlights the sequence of nodes: **On Component Begin Overlap (Box)**, **Get Data Table Row DT\_Demo**, and **Set Character Part**.

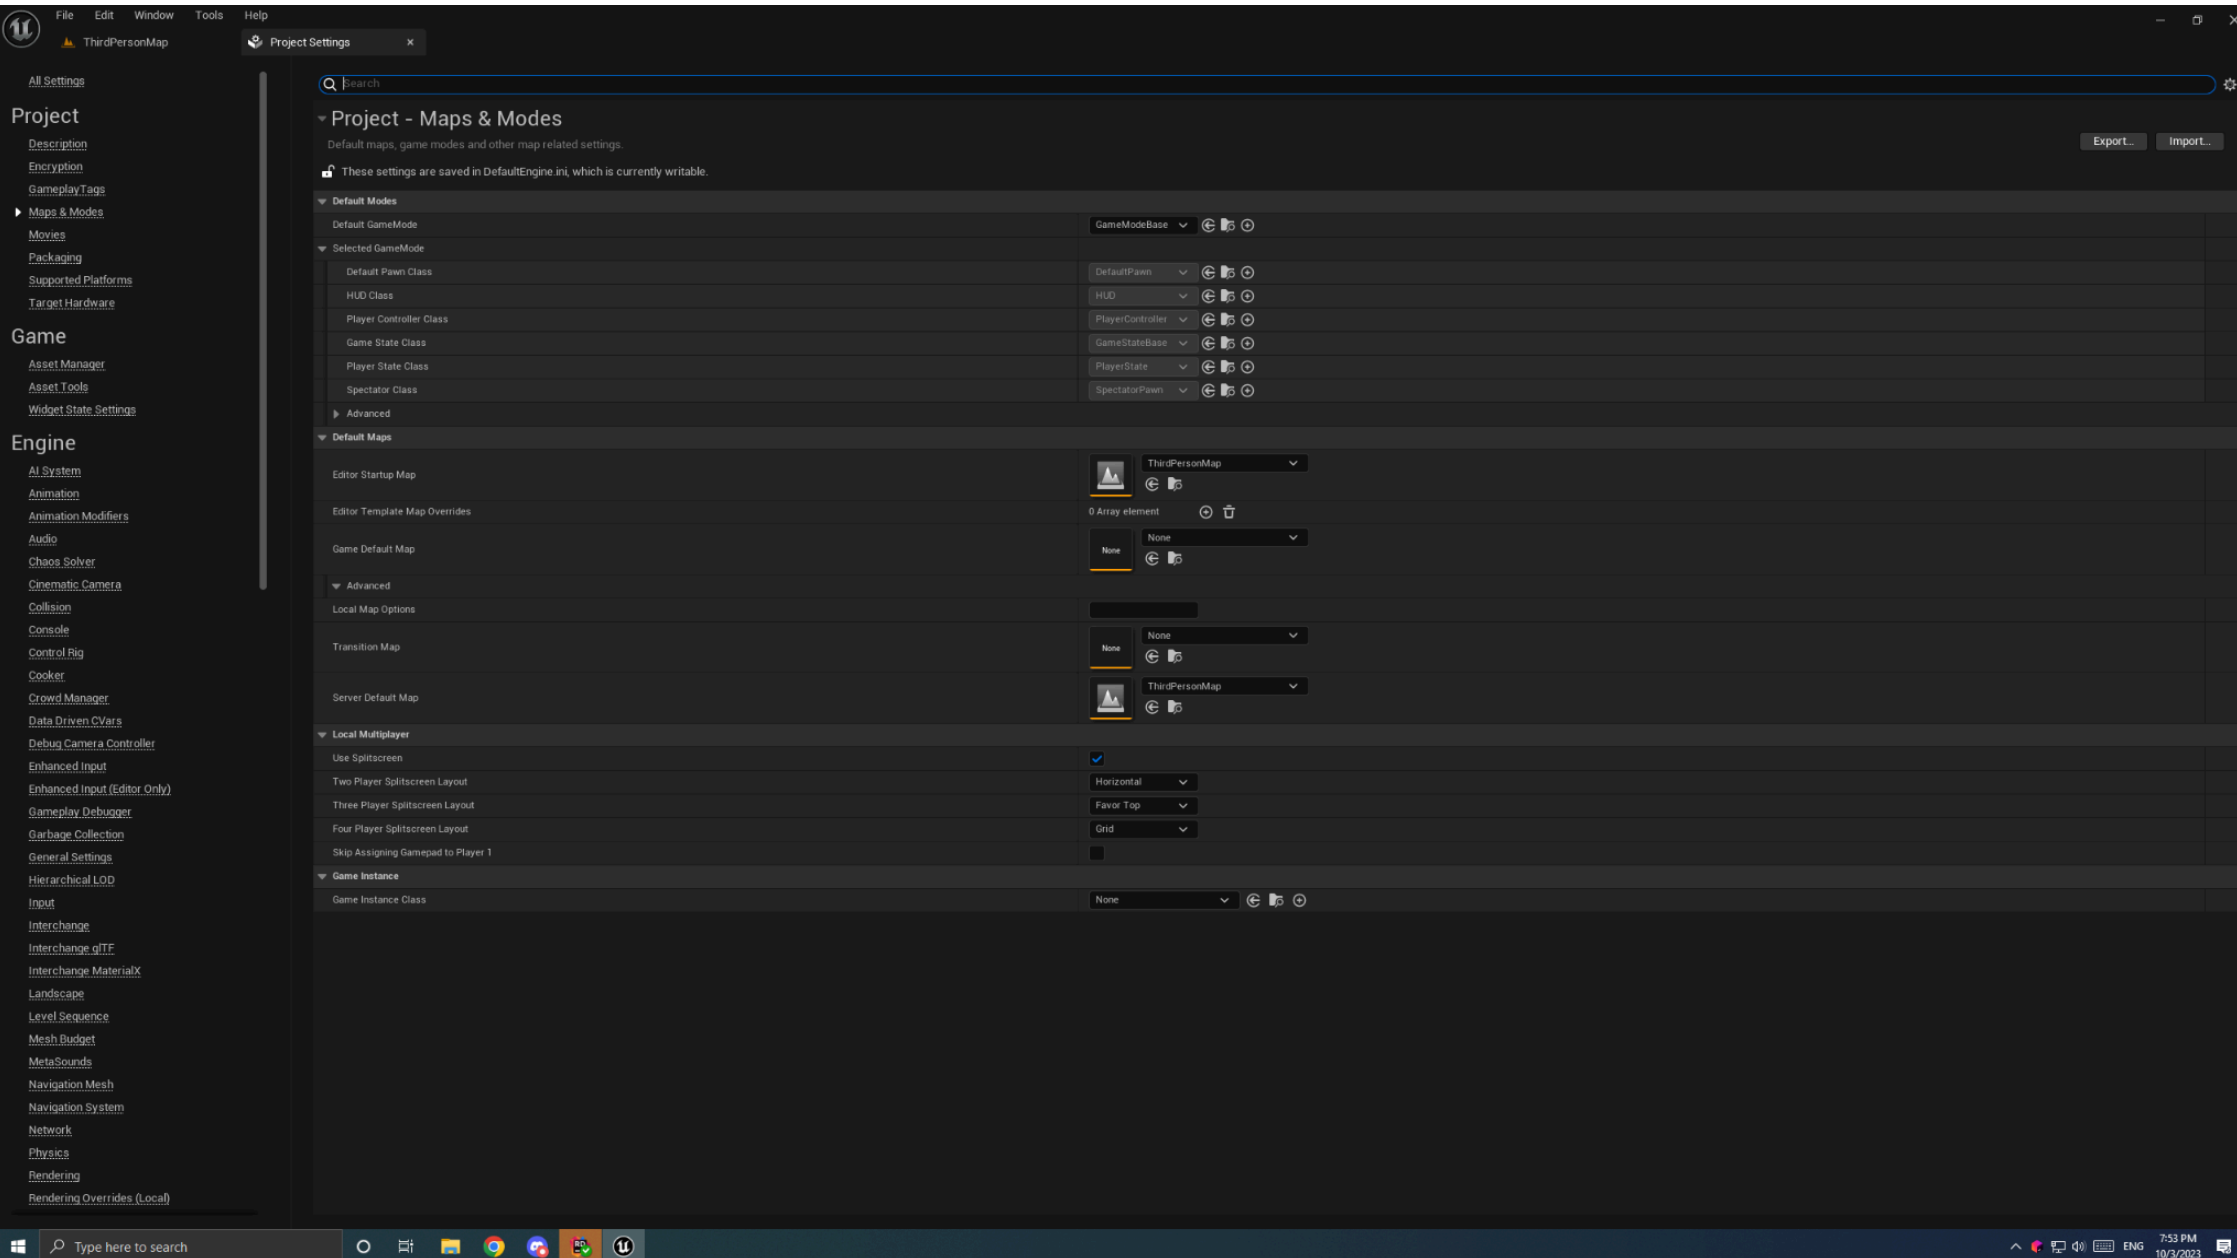

Text overlay: "In order to change part with a trigger box"

# Persistent Part Data Storing [[VIDEO](#)]

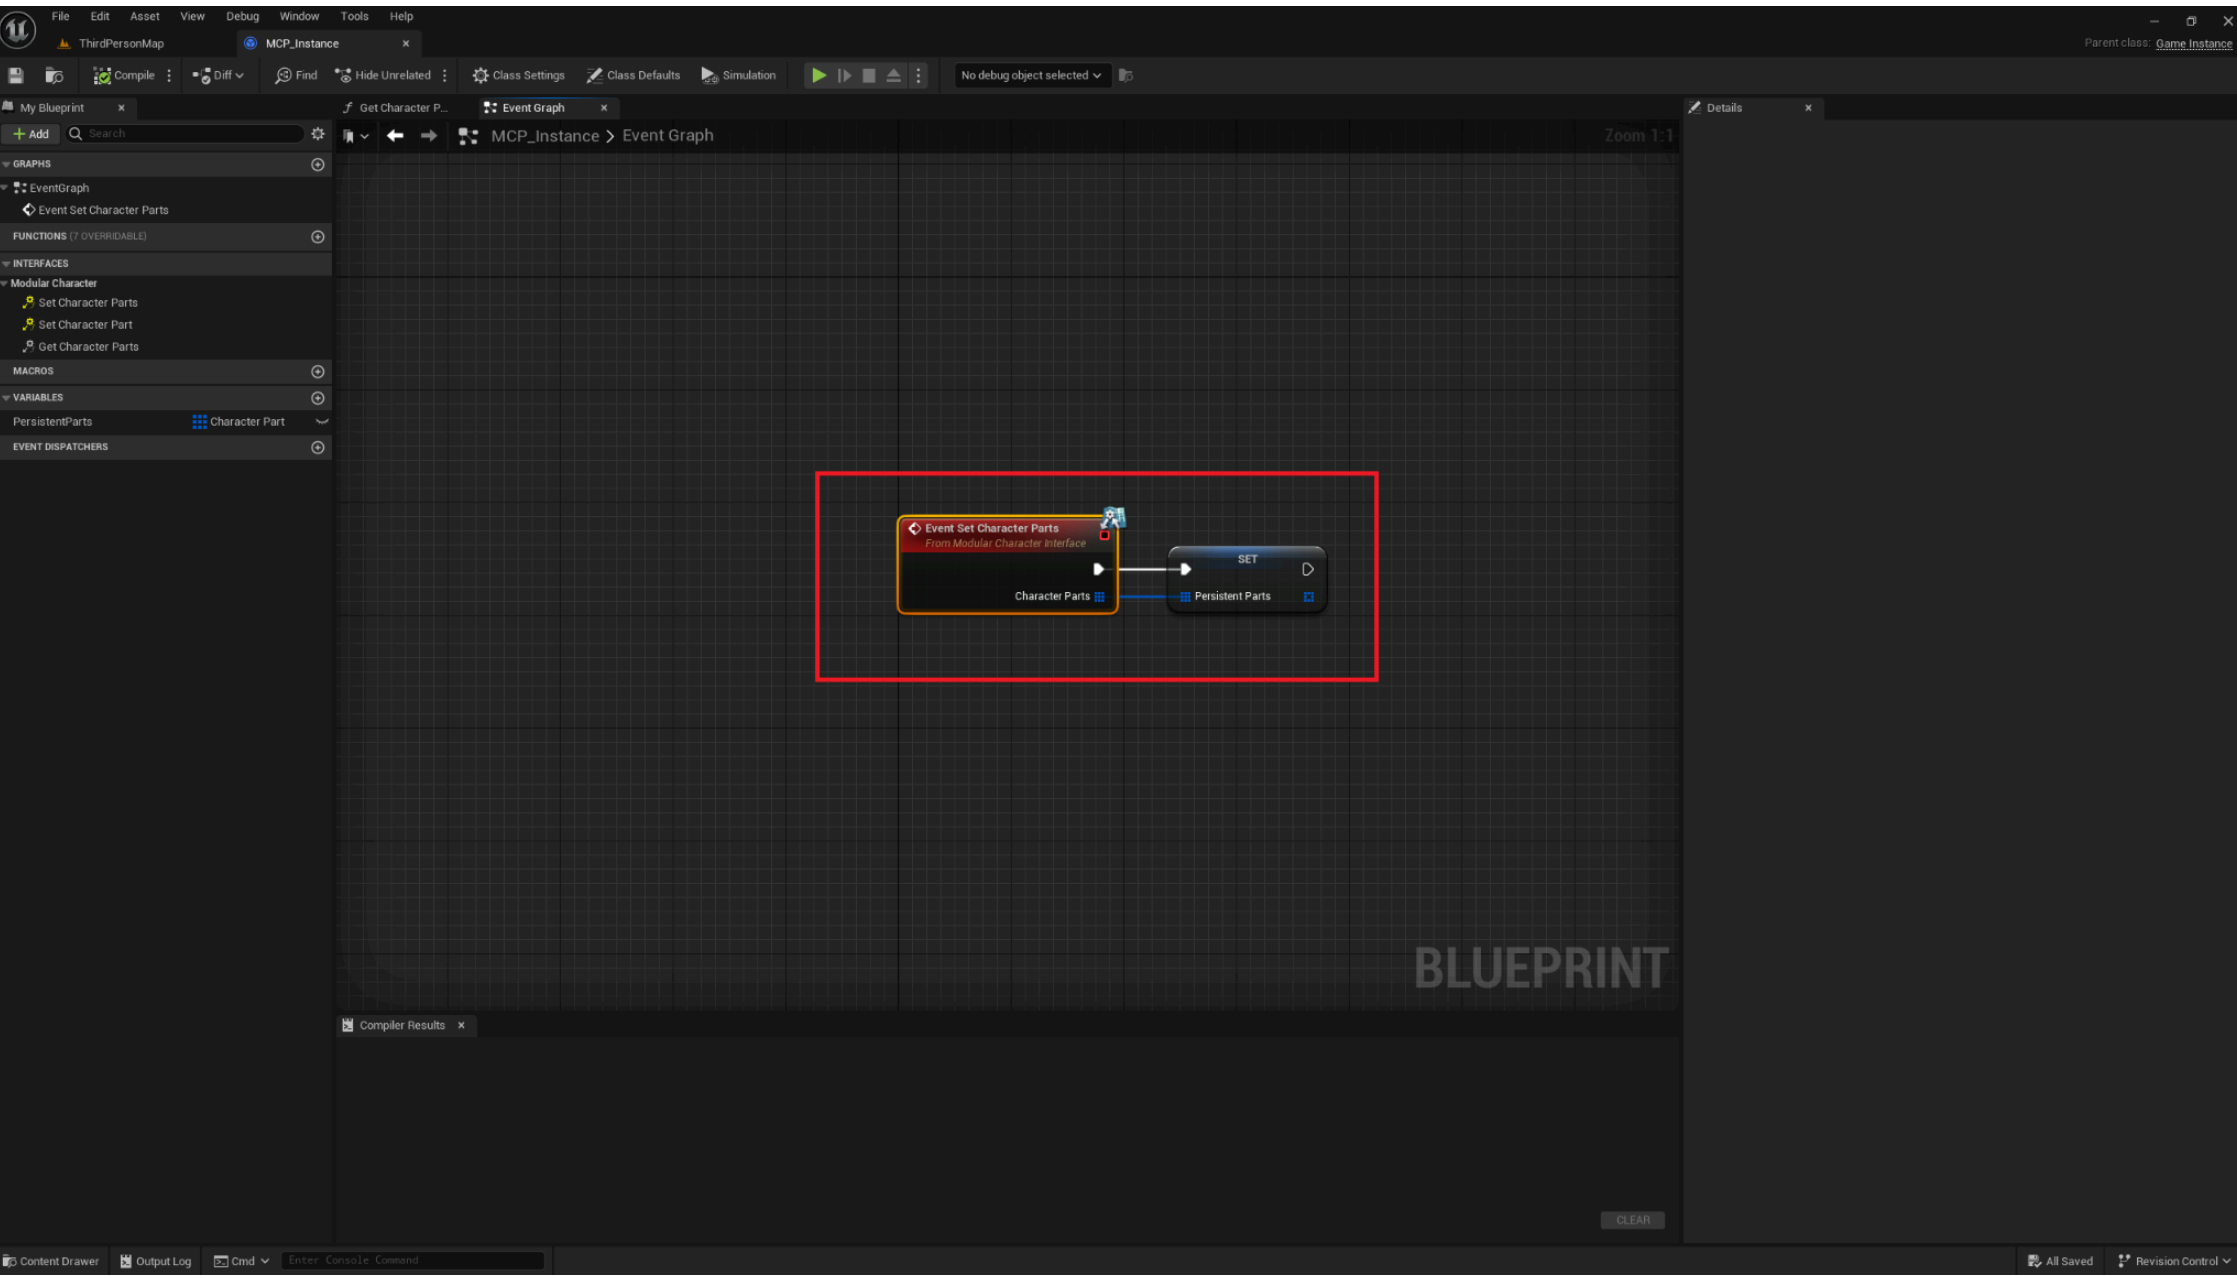

Create A Game Instance and set it to Default Game Instance from Project Settings -> Maps&Modes-> Default Game Instance

Implement The Modular Character Interface to created GameInstance from Class Settings -> Interfaces -> Add

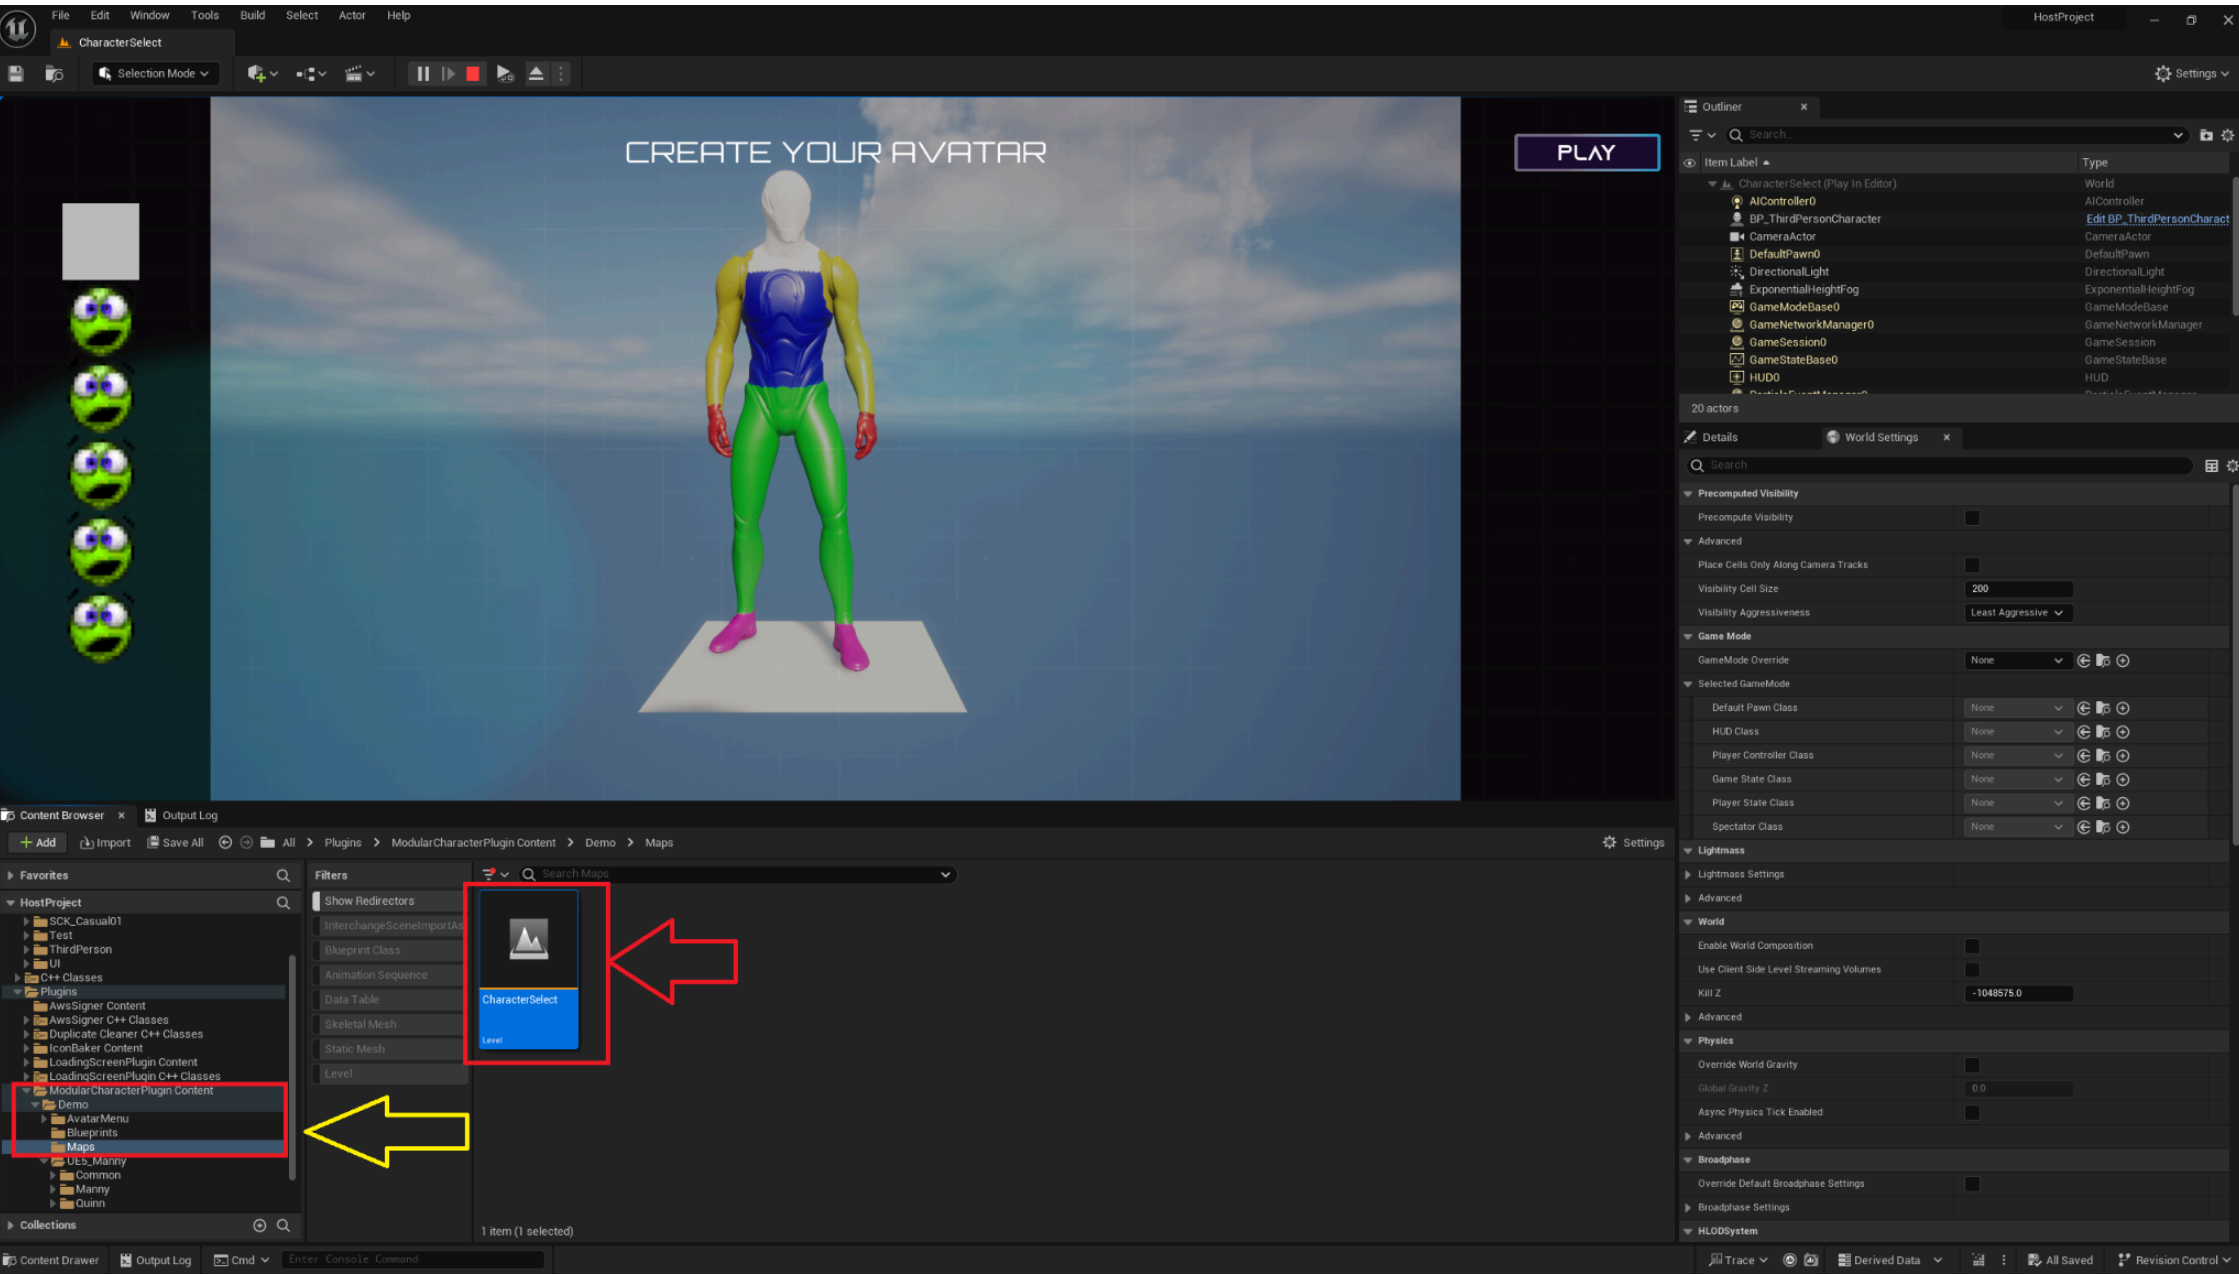

Create an Array of FCharacterPart variable (TArray<FCharacterPart>) and implement set character parts & get character parts with using this variable

# Using Demo Character Selection Screen [\[VIDEO\]](#)

Open CharacterSelect level from Plugins->ModularCharacterPlugin's Content -> Maps

From Level Blueprint Select DataTable that you created before

If you select another blueprint instead of BP\_demo\_thirdperson you must replace character in this level and also level blueprint

Widget's part selection screen will be created for your data table dynamically.
