

1. Query all columns for all American cities in the **CITY** table with populations larger than 100000. The **CountryCode** for America is USA. The **CITY** table is described as follows:

**CITY**

| Field       | Type            |
|-------------|-----------------|
| ID          | NUMBER          |
| NAME        | VARCHAR2 ( 17 ) |
| COUNTRYCODE | VARCHAR2 ( 3 )  |
| DISTRICT    | VARCHAR2 ( 20 ) |
| POPULATION  | NUMBER          |

**2. Generate the following two result sets:**

1. Query an *alphabetically ordered* list of all names in **OCCUPATIONS**, immediately followed by the first letter of each profession as a parenthetical (i.e.: enclosed in parentheses). For example: AnActorName(A), ADoctorName(D), AProfessorName(P), and ASingerName(S).

2. Query the number of occurrences of each occupation in **OCCUPATIONS**. Sort the occurrences in *ascending order*, and output them in the following format:

There are a total of [occupation\_count] [occupation]s.

where [occupation\_count] is the number of occurrences of an occupation in **OCCUPATIONS** and [occupation] is the *lowercase* occupation name. If more than one *Occupation* has the same [occupation\_count], they should be ordered alphabetically.

**Note:** There will be at least two entries in the table for each type of occupation.

**Input Format**

The **OCCUPATIONS** table is described as follows:

| Column     | Type   |
|------------|--------|
| Name       | String |
| Occupation | String |

| Name      | Occupation |
|-----------|------------|
| Samantha  | Doctor     |
| Julia     | Actor      |
| Maria     | Actor      |
| Meera     | Singer     |
| Ashely    | Professor  |
| Ketty     | Professor  |
| Christeen | Professor  |
| Jane      | Actor      |
| Jenny     | Doctor     |
| Priya     | Singer     |

the following values: **Doctor, Professor, Singer or Actor.**

**Sample Input**

An **OCCUPATIONS** table that contains the following records:

**Sample Output**

Ashely(P)  
 Christeen(P)  
 Jane(A)  
 Jenny(D)  
 Julia(A)  
 Ketty(P)  
 Maria(A)  
 Meera(S)  
 Priya(S)  
 Samantha(D)  
 There are a total of 2 doctors.  
 There are a total of 2 singers.  
 There are a total of 3 actors.  
 There are a total of 3 professors.

**Explanation**

The results of the first query are formatted to the problem description's specifications.

The results of the second query are ascendingly ordered first by number of names corresponding to each profession (2<=2<=3<=3), and then alphabetically by profession (doctor<= singer, and actor<=professor).

**3. Employees With Missing Information**

Table: Employees

| Column Name | Type    |
|-------------|---------|
| employee_id | int     |
| name        | varchar |

employee\_id is the primary key for this table.

Each row of this table indicates the name of the employee whose ID is employee\_id.

Table: Salaries

| Column Name | Type |
|-------------|------|
| employee_id | int  |
| salary      | int  |

employee\_id is the primary key for this table.

Each row of this table indicates the salary of the employee whose ID is employee\_id.

Write an SQL query to report the IDs of all the employees with missing information. The information of an employee is missing if:

The employee's name is missing, or

The employee's salary is missing.

Return the result table ordered by employee\_id in ascending order.

The query result format is in the following example.

Example 1:

Input:

Employees table:

| employee_id | name     |
|-------------|----------|
| 2           | Crew     |
| 4           | Haven    |
| 5           | Kristian |

Salaries table:

| employee_id | salary |
|-------------|--------|
| 5           | 76071  |
| 1           | 22517  |
| 4           | 63539  |

Output:

| employee_id |
|-------------|
| 1           |
| 2           |

Explanation:

Employees 1, 2, 4, and 5 are working at this company.

The name of employee 1 is missing.

The salary of employee 2 is missing.

Example 1:

Input:

Logins table:

| user_id | time_stamp          |
|---------|---------------------|
| 6       | 2020-06-30 15:06:07 |
| 6       | 2021-04-21 14:06:06 |
| 6       | 2019-03-07 00:18:15 |
| 8       | 2020-02-01 05:10:53 |
| 8       | 2020-12-30 00:46:50 |
| 2       | 2020-01-16 02:49:50 |
| 2       | 2019-08-25 07:59:08 |
| 14      | 2019-07-14 09:00:00 |
| 14      | 2021-01-06 11:59:59 |

Output:

| user_id | last_stamp          |
|---------|---------------------|
| 6       | 2020-06-30 15:06:07 |
| 8       | 2020-12-30 00:46:50 |
| 2       | 2020-01-16 02:49:50 |

Explanation:

User 6 logged into their account 3 times but only once in 2020, so we include this login in the result table.

User 8 logged into their account 2 times in 2020, once in February and once in December. We include only the latest one (December) in the result table.

User 2 logged into their account 2 times but only once in 2020, so we include this login in the result table.

User 14 did not login in 2020, so we do not include them in the result table.

### 5. Customer Who Visited but Did Not Make Any Transactions

Table: Visits

| Column Name | Type |
|-------------|------|
| visit_id    | int  |
| customer_id | int  |

visit\_id is the primary key for this table.

This table contains information about the customers who visited the mall.

Table: Transactions

| Column Name    | Type |
|----------------|------|
| transaction_id | int  |
| visit_id       | int  |
| amount         | int  |

transaction\_id is the primary key for this table. This table contains information about the transactions made during the visit\_id.

Write a SQL query to find the IDs of the users who visited without making any transactions and the number of times they made these types of visits.

Return the result table sorted in any order. The query result format is in the following example.

Example 1:

Input:

Visits

| visit_id | customer_id |
|----------|-------------|
| 1        | 23          |
| 2        | 9           |
| 4        | 30          |
| 5        | 54          |
| 6        | 96          |
| 7        | 54          |
| 8        | 54          |

Transactions

| transaction_id | visit_id | amount |
|----------------|----------|--------|
| 2              | 5        | 310    |
| 3              | 5        | 300    |
| 9              | 5        | 200    |
| 12             | 1        | 910    |
| 13             | 2        | 970    |

Output:

| customer_id | count_no_trans |
|-------------|----------------|
| 54          | 2              |
| 30          | 1              |
| 96          | 1              |

Explanation:

Customer with id = 23 visited the mall once and made one

transaction during the visit with id = 12.

Customer with id = 9 visited the mall once and made one

transaction during the visit with id = 13.

Customer with id = 30 visited the mall once and did not make any transactions.

Customer with id = 54 visited the mall three times. During 2 visits they did not make any transactions, and during one visit they made 3 transactions.

Customer with id = 96 visited the mall once and did not make any transactions.

As we can see, users with IDs 30 and 96 visited the mall one time without making any transactions. Also, user 54 visited the mall twice and did not make any transactions.

## 6. Daily Leads and Partners

Table: DailySales

| Column Name | Type    |
|-------------|---------|
| date_id     | date    |
| make_name   | varchar |
| lead_id     | int     |
| partner_id  | int     |

This table does not have a primary key.

This table contains the date and the name of the product sold and the IDs of the lead and partner it was sold to. The name consists of only lowercase English letters.

Write an SQL query that will, for each date\_id and make\_name, return the number of distinct lead\_id's and distinct partner\_id's.

Return the result table in any order.

The query result format is in the following example.

Example 1:

Input:

DailySales table:

| date_id   | make_name | lead_id | partner_id |
|-----------|-----------|---------|------------|
| 2020-12-8 | toyota    | 0       | 1          |
| 2020-12-8 | toyota    | 1       | 0          |
| 2020-12-8 | toyota    | 1       | 2          |
| 2020-12-7 | toyota    | 0       | 2          |
| 2020-12-7 | toyota    | 0       | 1          |
| 2020-12-8 | honda     | 1       | 2          |
| 2020-12-8 | honda     | 2       | 1          |
| 2020-12-7 | honda     | 0       | 1          |
| 2020-12-7 | honda     | 1       | 2          |
| 2020-12-7 | honda     | 2       | 1          |

Output:

| date_id   | make_name | unique_leads | unique_partners |
|-----------|-----------|--------------|-----------------|
| 2020-12-8 | toyota    | 2            | 3               |
| 2020-12-7 | toyota    | 1            | 2               |
| 2020-12-8 | honda     | 2            | 2               |
| 2020-12-7 | honda     | 3            | 2               |

Explanation:

For 2020-12-8, toyota gets leads = [0, 1] and partners = [0, 1, 2] while honda gets leads = [1, 2] and partners = [1, 2].  
For 2020-12-7, toyota gets leads = [0] and partners = [1, 2] while honda gets leads = [0, 1, 2] and partners = [1, 2].

## 7. Patients With a Condition

Table: Patients

```
+-----+-----+
| Column Name | Type |
+-----+-----+
| patient_id  | int  |
| patient_name | varchar |
| conditions  | varchar |
+-----+-----+
```

patient\_id is the primary key for this table.

'conditions' contains 0 or more code separated by spaces.

This table contains information of the patients in the hospital.

Write an SQL query to report the patient\_id, patient\_name and conditions of the patients who have Type I Diabetes. Type I Diabetes always starts with DIAB1 prefix.

Return the result table in any order.

The query result format is in the following example.

Example 1:

Input:

Patients table:

```
+-----+-----+
| patient_id | patient_name | conditions |
+-----+-----+
| 1 | Daniel | YFEV COUGH |
| 2 | Alice | |
| 3 | Bob | DIAB100 MYOP |
| 4 | George | ACNE DIAB100 |
| 5 | Alain | DIAB201 |
+-----+-----+
```

Output:

```
+-----+-----+
| patient_id | patient_name | conditions |
+-----+-----+
| 3 | Bob | DIAB100 MYOP |
| 4 | George | ACNE DIAB100 |
+-----+-----+
```

Explanation: Bob and George both have a condition that starts with DIAB1.

8. Write a query identifying the *type* of each record in the **TRIANGLES** table using its three side lengths. Output one of the following statements for each record in the table:

- Equilateral:** It's a triangle with sides of equal length.
- Isosceles:** It's a triangle with sides of equal length.
- Scalene:** It's a triangle with sides of differing lengths.
- Not A Triangle:** The given values of *A*, *B*, and *C* don't form a triangle.

**Input Format**

The **TRIANGLES** table is described as follows:

| Column | Type    |
|--------|---------|
| A      | Integer |
| B      | Integer |
| C      | Integer |

Each row in the table denotes the lengths of each of a triangle's three sides.

**Sample Input**

| A  | B  | C  |
|----|----|----|
| 20 | 20 | 23 |
| 20 | 20 | 20 |
| 20 | 21 | 22 |
| 13 | 14 | 30 |

**Sample Output**

Isosceles  
Equilateral  
Scalene  
Not A Triangle

9. Julia just finished conducting a coding contest, and she needs your help assembling the leaderboard! Write a query to print the respective *hacker\_id* and *name* of hackers who achieved full scores for *more than one* challenge. Order your output in descending order by the total number of challenges in which the hacker earned a full score. If more than one hacker received full scores in same number of challenges, then sort them by ascending *hacker\_id*.

**Input Format**

The following tables contain contest data:

- Hackers:** The *hacker\_id* is the id of the hacker, and *name* is the name of the hacker.

| Column    | Type    |
|-----------|---------|
| hacker_id | Integer |
| name      | String  |

*Difficulty:* The *difficulty\_level* is the level of difficulty of the challenge, and *score* is the score of the challenge for the difficulty level.

| Column           | Type    |
|------------------|---------|
| difficulty_level | Integer |
| score            | Integer |

*Challenges:* The *challenge\_id* is the id of the challenge, the *hacker\_id* is the id of the hacker who created the challenge, and *difficulty\_level* is the level of difficulty of the challenge.

| Column           | Type    |
|------------------|---------|
| challenge_id     | Integer |
| hacker_id        | Integer |
| difficulty_level | Integer |

*Submissions*: The *submission\_id* is the id of the submission, *hacker\_id* is the id of the hacker who made the submission, *challenge\_id* is the id of the challenge that the submission belongs to, and *score* is the score of the submission.

| Column        | Type    |
|---------------|---------|
| submission_id | Integer |
| hacker_id     | Integer |
| challenge_id  | Integer |
| score         | Integer |

**Sample Input**

*Hackers* Table:

| hacker_id | name     |
|-----------|----------|
| 5580      | Rose     |
| 8439      | Angela   |
| 27205     | Frank    |
| 52243     | Patrick  |
| 52348     | Lisa     |
| 57645     | Kimberly |
| 77726     | Bonnie   |
| 83082     | Michael  |
| 86870     | Todd     |
| 90411     | Joe      |

*Difficulty* Table:

| difficulty_level | score |
|------------------|-------|
| 1                | 20    |
| 2                | 30    |
| 3                | 40    |
| 4                | 60    |
| 5                | 80    |
| 6                | 100   |
| 7                | 120   |

*Challenges* Table:

| challenge_id | hacker_id | difficulty_level |
|--------------|-----------|------------------|
| 4810         | 77726     | 4                |
| 21089        | 27205     | 1                |
| 36666        | 5580      | 7                |
| 66730        | 52243     | 6                |
| 71055        | 52243     | 2                |

*Submissions* Table:

| submission_id | hacker_id | challenge_id | score |
|---------------|-----------|--------------|-------|
| 68628         | 77726     | 36666        | 30    |
| 66300         | 77726     | 21089        | 10    |
| 40326         | 52243     | 36666        | 77    |
| 8941          | 27205     | 4810         | 4     |
| 83654         | 77726     | 66730        | 30    |
| 43353         | 52243     | 66730        | 0     |
| 56385         | 52348     | 71055        | 20    |
| 39784         | 27205     | 71055        | 23    |
| 94613         | 86870     | 71055        | 30    |
| 46788         | 52348     | 36666        | 0     |
| 93058         | 86870     | 36666        | 30    |
| 7344          | 8439      | 66730        | 92    |
| 2721          | 8439      | 4810         | 36    |
| 523           | 5580      | 71055        | 4     |
| 49105         | 52348     | 66730        | 0     |
| 56877         | 57645     | 66730        | 80    |
| 38355         | 27205     | 66730        | 35    |
| 3924          | 8439      | 36666        | 80    |
| 97397         | 90411     | 66730        | 100   |
| 84162         | 83082     | 4810         | 40    |
| 97431         | 90411     | 71055        | 30    |

**Sample Output**  
90411 Joe

Challenges Table:

| challenge_id | hacker_id | difficulty_level |
|--------------|-----------|------------------|
| 4810         | 77726     | 4                |
| 21089        | 27205     | 1                |
| 36566        | 5580      | 7                |
| 66730        | 52243     | 6                |
| 71055        | 52243     | 2                |

Submissions Table:

| submission_id | hacker_id | challenge_id | score |
|---------------|-----------|--------------|-------|
| 66628         | 77726     | 36566        | 30    |
| 66300         | 77726     | 21089        | 10    |
| 40326         | 52243     | 36566        | 77    |
| 8941          | 27205     | 4810         | 4     |
| 60554         | 77726     | 66730        | 30    |
| 43353         | 52243     | 66730        | 0     |
| 55385         | 52348     | 71055        | 20    |
| 39784         | 27205     | 71055        | 23    |
| 94613         | 86870     | 71055        | 30    |
| 45788         | 52348     | 36566        | 0     |
| 93058         | 86870     | 36566        | 30    |
| 7344          | 8439      | 66730        | 92    |
| 2721          | 8439      | 4810         | 36    |
| 523           | 5580      | 71055        | 4     |
| 49105         | 52348     | 66730        | 0     |
| 56877         | 57645     | 66730        | 80    |
| 30355         | 27205     | 66730        | 35    |
| 3924          | 8439      | 36566        | 60    |

Sample Output  
90411 Joe

10. You are given two tables: *Students* and *Grades*. *Students* contains three columns *ID*, *Name* and *Marks*.

| Column       | Type           |
|--------------|----------------|
| <i>ID</i>    | <i>Integer</i> |
| <i>Name</i>  | <i>String</i>  |
| <i>Marks</i> | <i>Integer</i> |

*Grades* contains the following data:

| Grade | Min_Mark | Max_Mark |
|-------|----------|----------|
| 1     | 0        | 9        |
| 2     | 10       | 19       |
| 3     | 20       | 29       |
| 4     | 30       | 39       |
| 5     | 40       | 49       |
| 6     | 50       | 59       |
| 7     | 60       | 69       |
| 8     | 70       | 79       |
| 9     | 80       | 89       |
| 10    | 90       | 100      |

*Ketty* gives *Eve* a task to generate a report containing three columns: *Name*, *Grade* and *Mark*. *Ketty* doesn't want the NAMES of those students who received a grade lower than 8. The report must be in descending order by grade -- i.e. higher grades are entered first. If there is more than one student with the same grade (8-10) assigned to them, order those particular students by their name alphabetically. Finally, if the grade is lower than 8, use "NULL" as their name and list them by their grades in descending order. If there is more than one student with the same grade (1-7) assigned to them, order those particular students by their marks in ascending order. Write a query to help *Eve*.

### Sample Input

| ID | Name     | Marks |
|----|----------|-------|
| 1  | Julia    | 88    |
| 2  | Samantha | 68    |
| 3  | Maria    | 99    |
| 4  | Scarlet  | 78    |
| 5  | Ashley   | 63    |
| 6  | Jane     | 81    |

### Sample Output

Maria 10 99  
Jane 9 81  
Julia 9 88  
Scarlet 8 78  
NULL 7 63  
NULL 7 68

### Note

Print "NULL" as the name if the grade is less than 8.

### Explanation

Consider the following table with the grades assigned to the students:

| ID | Name     | Marks | Grade |
|----|----------|-------|-------|
| 1  | Julia    | 88    | 9     |
| 2  | Samantha | 68    | 7     |
| 3  | Maria    | 99    | 10    |
| 4  | Scarlet  | 78    | 8     |
| 5  | Ashley   | 63    | 7     |
| 6  | Jane     | 81    | 9     |

So, the following students got 8, 9 or 10 grades:

- Maria (grade 10)
- Jane (grade 9)
- Julia (grade 9)
- Scarlet (grade 8)

### 4. Table: Logins

| Column Name | Type     |
|-------------|----------|
| user_id     | int      |
| time_stamp  | datetime |

(user\_id, time\_stamp) is the primary key for this table.

Each row contains information about the login time for the user with ID user\_id.

Write an SQL query to report the latest login for all users in the year 2020. Do not include the users who did not login in 2020.

Return the result table in any order.

The query result format is in the following example.
