

This is timeline for GSoC Project “Windows Shellcode and Code Obfuscation modules” with organization OWASP ZSC.

### **Week 1 and Week 2**

- Add opcoder for windows shellcode like this one which is for linux.
- Add Execute shellcode for windows.
- Start work for Writing to file shellcode.

### **Week 3**

- Complete writing to file shellcode.
- Add create directory shellcode.

### **Week 4 and Week 5**

- Add shellcode Download and Executing a file.
- Add shellcode for creating user and adding user to admin group.
- Add shellcode for creating a messagebox.

### **Week 6 and Week 7**

- Add shellcode for disabling firewall.
- Add other shellcodes which will be required.
- Add Documentation for all windows shellcode.

### **Week 8**

- Add Simple Reverse hex and flip bit hex obfuscation modules. Both the modules will be created in python, perl, javascript, ruby and php.
- Add Simple Reverse base64 and flip bit base64 obfuscation modules. Both the modules will be created in python, perl, javascript, ruby and php.

### **Week 9**

- Research on more complex Obfuscation modules particularly Collberg’s Algorithm and Chenxi Wang’s Algorithm.
- Start working on Colberg’s Algorithm at the end of the week.

### **Week 10**

- Complete Collberg’s Algorithm module.
- Implement Chenxi Wang’s obfuscation Algorithm.

### **Week 11**

- Add Rot13 encoding and Binary obfuscation modules. Both of the modules will be created in the languages mentioned above.
- Dummy code obfuscation modules in the languages python, ruby, php, perl and javascript.

Start adding encryption obfuscation modules in all the languages mentioned.

## **Week 12**

Add one more complex obfuscation module on which I will be doing more research in Week 9 and Community Bonding period. If I could not come up with good plan of one more complex obfuscation method then I will add few encryption modules in all languages.

Add documentation for obfuscation modules.

Clean up the code, test all the code again and prepare for final evaluation.
