

Timmins generally gets 20 cm more snow than New Liskeard by January. In 2020, they both got about 1/4 less of the snow they usually get but made up for it in rainfall precipitation, both averaging about 20 cm of rain in a year. What can you say about the amount of snow Timmins had in comparison to New Liskeard? What would you say about the total accumulation of precipitation when comparing both communities? How do you know?
