

# Fat loss with cheating — full, practical guide

## Big idea in one line

You can have cheat meals and still lose fat — as long as your overall energy balance and consistency stay in your favor. Cheats should be planned and managed, not accidental binges.

## 1) Step one: find your baseline (maintenance) and your fat loss calories

You need a working calorie target.

Simple, reliable approach:

1. Convert weight from kilograms to pounds if needed.  
Example:  $80 \text{ kg} = 80 \times 2.20462 = 176.3696 \text{ lbs}$  (round to 176 lbs).
2. Rough maintenance estimate = bodyweight (lbs)  $\times$  15.  
Example:  $176 \times 15 = 2,640 \text{ calories/day}$  (this is a reasonable starting estimate for maintenance).
3. For fat loss, aim for a 15–25% deficit from maintenance. 20% is a good middle ground.  
 $20\% \text{ of } 2,640 = 2,640 \times 0.20 = 528 \text{ calories}$ .
4. Calorie goal = maintenance – deficit.  
 $2,640 - 528 = 2,112 \text{ calories/day}$ .

So for an 80 kg (176 lb) person, a starting fat loss target  $\approx$  2,112 kcal/day.

If you prefer metric formulas or exact TDEE, use whichever calculator you trust and then apply the 15–25% deficit.

## 2) Macro rules (simple, non-fussy)

Use macros to hold muscle and feel good.

For the 2,112 kcal example:

- Protein: 2.0 g per kg bodyweight is a great target.  
 $80 \text{ kg} \times 2.0 = 160 \text{ g protein.}$   
Calories from protein =  $160 \text{ g} \times 4 \text{ kcal/g} = 640 \text{ kcal.}$
- Fat: 25% of total calories is sensible.  
 $2,112 \times 0.25 = 528 \text{ kcal from fat.}$   
Grams of fat =  $528 \div 9 = 58.666\dots \rightarrow$  round to 59 g fat.
- Carbs: remaining calories.  
Remaining kcal =  $2,112 - (640 + 528) = 2,112 - 1,168 = 944 \text{ kcal.}$   
Carbs grams =  $944 \div 4 = 236 \text{ g carbs.}$

Summary for this example:

- 2,112 kcal per day
- Protein 160 g, Fat 59 g, Carbs 236 g

Adjust protein between 1.6–2.2 g/kg depending on how aggressive you want to be and how hungry you are.

### 3) How to include cheats — sensible options

There are several strategies. Pick one that fits your personality.

#### Option A — Cheat meal (recommended)

One planned cheat meal per week. Keep it to a single meal, not a full day. Make the cheat meal fitting into your weekly calories.

How to manage:

- Estimate cheat meal calories (for example 700–1,000 kcal).
- If cheat is 900 kcal, plan the rest of the day to be 200–400 kcal below your usual to keep the weekly balance reasonable.
- Or accept a small weekly overshoot and make up extra deficit across the next 2–3 days (eat slightly lighter).

Why this works: you get the reward without wiping out weekly progress.

### **Option B — Cheat snack / planned treat**

Lower risk. Fit a small treat daily or 3 times per week (e.g., 150–300 kcal). This is sustainable and reduces binge risk.

### **Option C — Refeed day (for experienced dieters)**

A higher-carb, moderate-calorie day every 7–14 days designed to refill glycogen, support hormones, and help training performance. Not a binge. Typically 1.1–1.3× maintenance calories with higher carbs.

### **Option D — Flexible dieting approach (If It Fits Your Macros)**

Track the day. Eat your protein, fats, carbs and fit a treat into your daily total. Works well for disciplined trackers.

## **4) Practical cheat rules (to avoid self-sabotage)**

1. Avoid cheat day. Don't let one meal become a whole day.
2. Plan your cheat ahead, and budget calories for it.
3. Prefer high-satiety protein + vegetable before a cheat dessert so you don't overeat.
4. Use the 80/20 mindset: 80 percent of meals are on-target, 20 percent relaxed. Not an excuse to go wild.
5. Keep alcohol in check. Empty calories and it increases appetite.
6. If you binge by accident, reset immediately. Do not let one mistake become a week-long pattern.

## **5) Weekly calorie math cheat example**

If your daily goal is 2,112 kcal, weekly calories =  $2,112 \times 7 = 14,784$  kcal.

If you plan a single cheat meal of 1,200 kcal above normal:

- Weekly surplus from cheat = 1,200 – 2,112/3? Simpler: treat cheat as +1,200 extra on that day.
- To remain roughly on track, spread –1,200 over the other 6 days: –200 kcal/day (2,112 – 200 = 1,912 kcal on those days).  
That keeps the weekly total similar.

## 6) Training and activity (must pair with calories)

1. Resistance training 3–5 times per week. Prioritize compound lifts: squat, deadlift, bench, row, pull-up, overhead press. Keep reps 6–12 for hypertrophy most of the time.
2. Add 2–4 cardio/conditioning sessions weekly as needed (20–40 minutes steady or HIIT 10–20 minutes). Cardio helps energy expenditure but do not replace strength work.
3. NEAT matters. Walk more, stand more. 30–60 extra minutes of walking per day makes a big difference for fat loss.
4. Keep progressive overload in strength training to retain muscle while losing fat.

## 7) Sample training split (beginner-intermediate)

- Mon: Upper body heavy (bench, row, pull-ups)
- Tue: Lower body heavy (squat, Romanian deadlift)
- Wed: Active rest or walk + core
- Thu: Upper hypertrophy (incline, lateral raises, curls)
- Fri: Lower hypertrophy (lunges, leg press, calf work)
- Sat: Conditioning + accessory work
- Sun: Rest or light walk

Adjust to your schedule. Prioritize consistency.

## 8) Meal timing and hunger management

- Eat protein first at meals to help satiety.
- Fill half your plate with vegetables and fiber to control calories.
- Include a protein source in every meal.
- If you plan a cheat later, have a sensible, protein-forward earlier meal to reduce overconsumption.

## 9) Sample daily template with one weekly cheat meal

Daily target = 2,112 kcal (example)

- Breakfast: 40 g protein (eggs/Greek yogurt), oats, fruit.
- Lunch: 40–50 g protein, rice/roti, vegetables.
- Pre-workout: small carb + protein snack.
- Post-workout: 30–40 g protein shake + carb.
- Dinner: 40–50 g protein, vegetables, healthy fat.
- Snacks to hit macros.

One weekly cheat: Saturday dinner — pizza or burger. Plan the rest of the day slightly under calories or do extra walk.

## 10) Tracking and progress rules

- Weigh once per week, same time and conditions.
- Track three methods: weight, waist measurement, and progress photos every 2 weeks. Photos + measurements matter more than daily weigh-ins.

- If you are not losing ~0.5–1% bodyweight per week after 3 weeks, adjust calories down by 5–10% or increase activity. Example: from 2,112 → reduce by 5% = 2,112 – 105.6 = 2,006 kcal/day. Do that for 2–3 weeks and reassess.
- Hold protein constant when cutting calories to preserve muscle.

## 11) Psychology and social tips

- Make cheats social and enjoyable so they feel earned but not excessive.
- Pre-commit rules: “I will eat one burger and one small fries, then stop.” Set a limit.
- If you travel or have celebrations, plan a refeed day instead of a week of overeating.
- Sleep and stress management reduce cravings and emotional binges.

## 12) Example 4-week plan (with one cheat meal weekly)

Week 1–2:

- Calories: maintenance –20% (calculate for yourself).
- Training: 4× resistance, 2× light cardio.
- One planned cheat meal saturday evening, 700–900 kcal. Balance earlier meals.

Week 3:

- Re-evaluate weight and photos. If progress is good, continue. If stalled, reduce calories 5% or add 10–20 min daily walking.

Week 4:

- Test a refeed if energy is low: one day at maintenance with higher carbs. Not a binge.

Repeat, adjust, and keep protein high.

## 13) Common FAQs

Q: Can I still lose fat if I binge occasionally?

A: Yes, but frequency and size matter. Occasional planned cheats are fine. Frequent binges will stall progress.

Q: Is a cheat day ever okay?

A: For most people, cheat day leads to overeating. Better to use cheat meal or controlled refeed.

Q: Will cheats ruin my hormones or metabolism?

A: Occasional cheats do not break metabolism. Long-term overfeeding slows fat loss. Planned refeeds can help hunger and performance.

Q: How do I stop emotional eating?

A: Build routines, sleep more, manage stress, and replace triggers with low-calorie rituals (walk, call a friend).

## 14) Tools to use

- Food tracker: MyFitnessPal, Cronometer, or any calorie app.
- Scale, tape measure, progress photo folder.
- Step counter or watch for NEAT tracking.
- Spreadsheet to track weekly weight and cheat meals.

## 15) Quick checklist before you start

- Calculate maintenance and set a 15–25% deficit.
- Set protein target 1.6–2.2 g/kg.
- Plan training 3–5x week.
- Choose cheat strategy (meal vs snack vs refeed).
- Track weight and photos weekly.
- Reassess every 2–3 weeks and adjust.

## Final practical example recap (80 kg person)

- Maintenance estimate = 2,640 kcal/day.
- 20% deficit = 528 kcal.
- Daily target =  $2,640 - 528 = 2,112$  kcal.
- Protein 160 g (640 kcal), Fat 59 g (528 kcal), Carbs 236 g (944 kcal).
- One weekly cheat meal 800–1,000 kcal, planned and budgeted.
