

# Setting up Super Dev Mode for Debugging App Inventor

Reference: <http://www.gwtproject.org/articles/superdevmode.html>

- **Step 1:** In `/appinventor/appengine/build.xml` file, in 'YaClientApp' ant target, change java task's classname attribute's value to "com.google.gwt.dev.DevMode". (See [Line 461](#))
- **Step 2:** Clean with '`ant clean`' and build with '`ant noplay`' command.

- **Step 3:** Open '<http://localhost:9876>' in your browser and the following page appears. This indicates that the Google Code Server is now running successfully.

# GWT Code Server

1. Drag these two bookmarklets to your browser's bookmark bar:

Dev Mode On   Dev Mode Off

2. Visit a web page that uses one of these modules:

- ode

3. Click "Dev Mode On" to start development mode.

- **Step 4:** Run local App Engine server to build files to this directory `'appinventor\appengine\build\war\ode'` by using this command

```
%AppEnginePath%/bin/dev_appserver.cmd --port=4242 --address=0.0.0.0  
appengine/build/war/
```

Note that I've changed the port to 4242 intentionally.

- **Step 5:** Open `'http://localhost:4242'` to open the App Inventor web app. Below screenshot is taken while it was compiling.

**Done!**

**Notes:**

- I had to kill JVM, clean the project and build again (Step 2) in order to restart this process. I found that this happens because of missing `*.gwt.rpc` files in `'appinventor/appengine/build/war/ode'` folder.
- To check compiled files, go to <http://localhost:9876/ode/>
- To recompile the ode module, click on "Clean" button on GWT Code Server page.
- View sourcemaps from browser (can be used for debugging) here: <http://localhost:9876/sourcemaps/ode/>
- View logs here: <http://localhost:9876/log/ode>
