***Abstract.** The increasing proportion of elderly individuals within correctional facilities has become a pressing concern for both human rights advocates and healthcare professionals. As societies grapple with the complexities of an aging population, the unique needs of elderly detainees must be addressed with urgency and compassion. This article outlines critical measures that can be implemented to enhance the care and well-being of elderly detainees, focusing on healthcare accessibility, environmental adaptations, social support structures, and comprehensive training for staff.*

***Keywords** health, social support and staff training*

INTRODUCTION

One of the foremost considerations in improving the care of elderly detainees is ensuring their access to adequate healthcare services. Many elderly inmates suffer from chronic health conditions, including cardiovascular diseases, diabetes, and neurological disorders. The prevalence of these conditions necessitates a systematic approach to healthcare delivery within correctional settings.

To address this issue, correctional facilities should implement regular health screenings and assessments tailored to the unique needs of elderly detainees. Establishing partnerships with local healthcare providers can facilitate the provision of specialized medical care, including geriatric assessments and management. Furthermore, the integration of telemedicine services can enhance access to healthcare providers, overcoming the limitations imposed by geographic isolation and limited mobility.

In addition to medical care, mental health services are equally vital. Elderly detainees often face psychological challenges due to isolation, loss of autonomy, and the stigma associated with incarceration. Facilities should prioritize the availability of

mental health professionals trained in geriatric care to provide counseling and therapeutic services. Programs that promote mental wellness, such as mindfulness, art therapy, or engagement in recreational activities, can significantly enhance the overall psychological well-being of elderly detainees.

LITERATURE REVIEW

The literature on the care and well-being of elderly detainees in correctional facilities in Indonesia remains relatively limited, but attention to this topic is increasing along with the growing elderly prison population. According to research by Supriyadi (2019), elderly detainees face greater challenges in correctional institutions, including chronic physical health issues and limited access to adequate medical care. Mental health is also a serious concern, as older adults are more vulnerable to depression and anxiety, particularly in conditions of isolation and limited social support (Pratama, 2020). In Indonesia, the healthcare system in correctional facilities has not yet fully accommodated the specific needs of the elderly population, such as regular health check-ups, long-term care, and rehabilitation support (Rahmawati & Putra, 2021).

In addition, infrastructure and training limitations among correctional staff are obstacles to providing comprehensive care for elderly detainees. A study by Wibowo (2022) found that many correctional officers feel they lack sufficient knowledge to handle detainees with complex physical and mental needs. The lack of rehabilitation programs tailored for elderly detainees also impacts their quality of life during detention, which in turn can affect their overall health (Amalia, 2021). Studies in other countries, such as the United States and Japan, show that an ideal correctional system for elderly detainees involves integrated care that includes physical and mental health, as well as social support, often through collaboration with public health services (Turner & Peacock, 2018; Nakamura, 2019). In the Indonesian context, this literature underscores the importance of developing more inclusive and adaptive policies to meet the needs of elderly detainees in correctional institutions.

METHODS

This research employed a mixed-methods approach to explore efforts to enhance the care and well-being of elderly detainees. The study was conducted in two phases: a

quantitative analysis of health and well-being data for elderly detainees and a qualitative exploration of experiences and perceptions from both detainees and correctional staff. Participants included detainees aged 60 and above from three correctional facilities in correctional and 30 staff members (medical, security, and social workers) involved in the care of elderly detainees. Quantitative data were collected through structured interviews using standardized instruments, such as the SF-36 Health Survey for physical health, the Geriatric Depression Scale for mental health, and the WHOQOL-OLD for quality of life. Qualitative data were obtained through semi-structured interviews and focus group discussions with correctional staff, focusing on care access, well-being perceptions, and specific needs of elderly detainees. Quantitative data were analyzed using descriptive statistics and multivariate regression, while qualitative data were thematically analyzed to identify key patterns. The study also considered ethical aspects by obtaining approval from the Research Ethics Committee and securing informed consent from each participant, ensuring confidentiality and voluntary participation.

RESULTS

The study results indicate that the health and well-being of elderly detainees generally require special attention. Quantitative data revealed that 70% of elderly detainees suffer from chronic physical health conditions, such as hypertension and diabetes, while 45% exhibit symptoms of depression or anxiety. Their quality of life is rated as moderate to low, especially concerning mobility and access to healthcare services. Qualitative analysis found that elderly detainees feel they receive insufficient support for their physical and mental health needs. Correctional staff reported that the lack of facilities specifically designed for elderly detainees is a major obstacle to providing optimal care. Additionally, staff members feel undertrained in addressing the unique needs of the elderly population, leading to dissatisfaction among both detainees and staff in the care process. These findings highlight the need for developing more targeted programs and facilities to meet the care and well-being needs of elderly detainees in correctional institutions.

DISCUSSION

Environmental Adaptations

The physical environment of correctional facilities can significantly impact the well-being of elderly detainees. Many traditional facilities are not designed to accommodate the mobility and sensory impairments common among older adults. To create a more supportive environment, facilities should undertake comprehensive assessments of their infrastructure with a focus on accessibility.

Implementing modifications such as grab bars, non-slip flooring, and wheelchair-accessible facilities can help prevent falls and promote independence. Additionally, adequate lighting and clear signage can aid individuals with visual impairments. Common areas should be designed to encourage social interaction while providing comfortable seating arrangements that accommodate the needs of elderly inmates.

Furthermore, facilities should consider the introduction of specialized units for elderly detainees, where tailored programming and support can be provided. These units can foster a sense of community and belonging, reducing feelings of isolation and vulnerability.

Social Support Structures

Social connections play a crucial role in the mental and emotional well-being of elderly detainees. The loss of family ties and community support can exacerbate feelings of loneliness and despair. Implementing structured programs that facilitate social engagement can be instrumental in addressing these challenges.

Correctional facilities should create opportunities for elderly detainees to participate in group activities, such as educational workshops, exercise classes, or hobby groups. These programs can promote socialization, cognitive stimulation, and physical activity, which are essential components of healthy aging. Additionally, establishing mentorship

programs that pair younger inmates with elderly detainees can foster intergenerational relationships and mutual support.

Family visitation policies should also be examined and improved to facilitate meaningful connections between elderly detainees and their loved ones. Flexible visiting hours, comfortable visitation spaces, and the use of technology for virtual visits can help maintain familial bonds, enhancing the emotional well-being of elderly inmates.

Comprehensive Training for Staff

The successful implementation of measures to improve the care of elderly detainees relies heavily on the training and education of correctional staff. Staff members must be equipped with the knowledge and skills necessary to understand the unique needs of elderly individuals within the correctional system.

Training programs should encompass geriatric care principles, including the physical and psychological aspects of aging, as well as effective communication strategies tailored to older adults. Staff should be educated on recognizing signs of physical and mental health issues, allowing for timely intervention and support.

Moreover, fostering a culture of empathy and respect within correctional facilities is essential. Staff should be encouraged to engage with elderly detainees compassionately, recognizing their dignity and humanity. Regular workshops and discussions on the importance of treating elderly inmates with respect can contribute to a more positive environment for both staff and detainees.

Policy Advocacy and Reform

Advocating for policy reform is crucial to advancing the rights and well-being of elderly detainees. Policymakers must recognize the unique vulnerabilities of this population and work towards legislative changes that prioritize their health and dignity.

Policies should be developed to guide the treatment of elderly detainees, establishing standards for healthcare access, environmental modifications, and staff training.

Furthermore, the implementation of alternatives to incarceration, such as community-based programs or home confinement for non-violent elderly offenders, should be explored to alleviate the challenges faced by this demographic within the correctional system.

Collaboration with advocacy groups can amplify the voices of elderly detainees, ensuring that their concerns and experiences are acknowledged in policy discussions. Engaging in research to identify best practices and evidence-based interventions for elderly detainees can further inform policies and practices at both local and national levels.

CONCLUSION

The care and well-being of elderly detainees are critical issues that demand immediate attention and action. By implementing measures that enhance healthcare accessibility, improve environmental conditions, foster social support, and provide comprehensive staff training, correctional facilities can create a more humane and supportive environment for elderly individuals. Furthermore, advocating for policy reform is essential to ensure that the rights and needs of elderly detainees are prioritized in the broader criminal justice landscape. As societies evolve, so too must the systems designed to care for their most vulnerable members, including the elderly within correctional settings.

LIMITATION

This study has several limitations that should be considered. First, it includes only three correctional facilities in one region, so the findings may not be fully generalizable to other facilities in different locations with varying conditions. Second, the qualitative data collection methods, such as interviews and focus group discussions, may introduce social desirability bias, where some participants may feel uncomfortable expressing their honest opinions, especially regarding service challenges. Additionally, the limited number of staff and elderly detainee participants may affect the variation in the data obtained. Finally, the study does not measure the long-term aspects of the proposed programs or facilities, so the sustained impact of improved services for elderly detainees

cannot be assessed. These limitations suggest the need for further studies involving more locations, participants, and longer timeframes to gain a more comprehensive understanding.
