

You can't automate an enterprise with OpenAI or Claude. At scale, consumer AI creates operational bottlenecks and compliance nightmares.

Intromatic audits your current tech stack and builds custom, in-house AI workflows for your specific processes. No ChatGPT, no Claude — it's a system that *you own*, designed to meet your current needs *and* to grow with you.

[Proposal Workflow Demo]

This workflow turned a three-day proposal-generation process and a two-week onboarding process into two clicks. [\[Show example proposal\]](#) Faster proposals means more deals closed; faster fulfillment means better retention. The workflow produced more consistent results than Claude with less than one percent of the computing, and the best part — it's all in-house. No sensitive data touches the internet, meaning privacy and security are baked in.

Our leadership team consists of a McKinsey consultant *and* a hardware engineer, meaning we can design the workflows *and* build the infrastructure.

[Kiosk Demo, preferably with video or animation of engagement and camera use]

For example, we built this digital ad kiosk that uses a camera to observe who looks at the ad, for how long, and uses image comprehension to record their demographics. But get this — the images aren't saved anywhere, just converted into raw data — one out of every four passerbys stopped and looked, women in her thirties looked at it twenty percent longer, etc. — so you get actionable data while preserving the privacy for your customers.

We follow a proven five-step process —

Understand.
Design.
Build.
Deploy.
Evolve.

Even if you're stuck at Google Sheets and filing cabinets, we can take your enterprise to end-to-end, fully compliant automation in as little as three months.

Intromatic — where AI meets enterprise.
