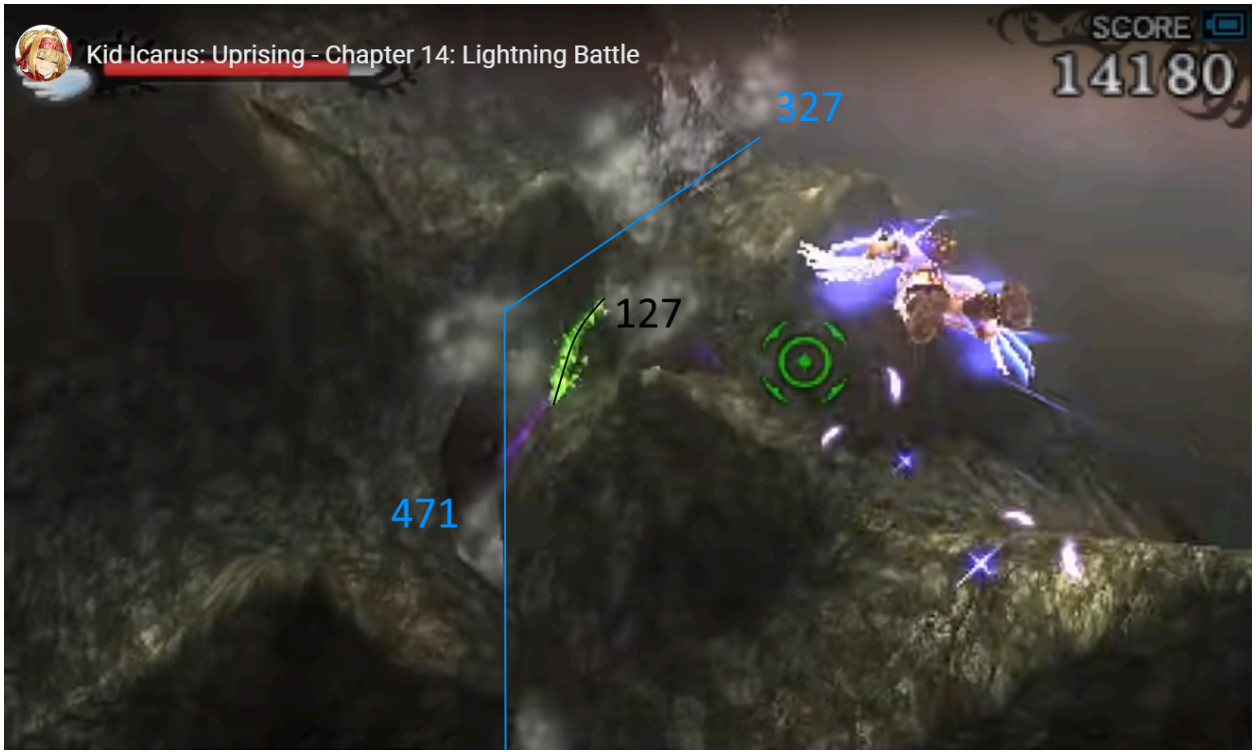
Feat here:
https://youtu.be/7U-MI7nqaVI?t=98

218/13 = 16.7692307692x ratio
1.8m height screw it, not much changes

16.7692307692 * 1.8 = 30.1846153846m Thanatos Dragon length (bear in mind it's shown later Thanatos is shown as inside the head of the dragon)

471 + 327 = 798px length total
798 / 127 = 6.28346456693x ratio

6.28346456693 * 30.1846153846 = 189.663961236 meters length



Height doesn't have a good way to measure but frame by framing it seems as though it's bare minimum Thanatos' length

It's triangular so

Surface area of 2862.4669 m^2
Shear strength of rock from what I can find is 1e7 N/m^2

1e7 * 2862.4669 = 28624669000 Newtons (j/m)
28624669000 * 189.663961236 = 5.4290681e+12 joules, **1.3 Kilotons, Small Town** minimum
