-[Basic Data]-

Date:	[03/12/24]
Anomalies:	[SCP-131]
Highest Containment Zone:	Cleanrooms ▾
Research Question:	SCP-131 is a friendly, outgoing, and kind, water drop shaped SCP. It is sentient, comes in many varieties, and personalities. Each will act a little different, have their own unique features, but tie together to form one species of SCP. Mainly, I will be focussing on their personalities and mental state, hence the emphasis on it. I will also be utilizing their preferences to my advantage. What I'm looking to know is: <u>do instances of SCP-131 get attached to inanimate objects?</u> My inspiration came when I saw multiple eye pods surrounding a bear the Medical Department offers.
Hypothesis:	The eyepods may be different in form, thought, and view, but they are still very sentient and are able to process what is happening. Because of this, they can house simple emotions like happy, sad, or angry. I will also be using a second instance of SCP-131 in my test to see how it behaves with others when presented with the bear. This is how I think it will go:

	Hypothesis One: SCP-131 will be defensive of the object, and not let others have it, but will hold a special bond with the original owner. Hypothesis Two: SCP-131 will show attraction towards the object, and let others share and or play with it. Hypothesis Three: SCP-131 will show no signs of affection or care for the bear. Though I cannot predict the exact results of the test, I can use expansive hypotheses to best describe my thinking.

-[Procedural Statement]-

STATEMENT:

"I **Agree** that I have followed all testing procedures and regulations throughout the duration of this test. I also understand that if a breach of procedure/regulation were to occur during this test that I may and will be punished."

-[Testing Results]-

No other SCP has been so responsive and friendly. I was able to conduct the test without issues, and was able to get my results. Let me tell you how it went. I arrive at CR, I get briefed, and enter the chamber of SCP-131. There, I see a red and yellow instance. Both were energetic, running around, and playful. It was awesome. When I enter, they come to greet me and I present them with two monkeys (provided by the Medical Department). As soon as I drop them both, they race to get one of their own. There was no need to share. However, I took one of their monkeys. Instantly, sadness filled him. Though, as soon as he spotted the other instance playing with their own, he went over and joined them. They were doing fine at first, but red began to fight with yellow, acting as if only they should play with it. Eventually, red was fully excluded. He looked at me with tears in his eyes. Then, I took the toy monkey and only gave it to red. Yellow saw this, and was jealous. He instantly ran over to it and stole it yet again. But this time when red went back to the toy, they talked it out, and were able to play together nicely. I asked them if they'd rather have their own, and they said yes. Once they were settled, I took the last and only monkey away from them. Both turned and stared at me, anger filled in their eyes. My escort advised me not to anger them much (I wasn't going too much as it hurt me too). Only seconds later I gave it back. Instantly, their old, happy selves reappeared. Once it seemed they were alright again, I asked them two questions: is the monkey your favorite toy, and would you still rather have your own monkey? I got two answers. The monkey is, indeed, their favorite toy, and no, they would rather play together. What a change in heart.

My Thought Process:

Went well, exceeded my expectations, and proved a theory. What I was doing was almost similar to a social experiment, but with SCPs. It worked great. The reason I used two was to see how they reacted with others. I feel only getting it with one wouldn't be enough, and wouldn't show the whole picture.

-[Conclusion]-

What Happened: In My Words:

Instances of SCP-131 experienced different emotions and reactions based on how they were played with. For example, taking or giving the monkey. They got super defensive and attached to the object, just like a human would to say their favorite blanket.

What Theory Was Proven and Future Ones:

Hypothesis Two was proven mainly, only varying slightly. If this is true, what other objects can be used to bond or manipulate with SCP-131? Do these factors apply to humans and other objects? Does their color affect their likeness to be affected?

Future Rationale:

Can different items and toys, such as the monkey the Medical Department holds, be used to shift the emotions of SCP-131 by befriending SCP-457, which instances of SCP-131 are known to hate.

Possible Use To Combative or Scientific Personnel:

The use of this information can provide easy containment, if SCP-131 is unwilling, or can be used to sway or tempt them into pushing themselves for testing (what is allowed, of course. I mean like if they're scared, they can be comforted and encouraged).

-[Evidence]-
