

This is it!! The climate meeting starting on 30.11.23 was another disappointment

Hello friends of the planet and all its life forms

The future is 30 years too late.

Human's period of rule must come to an end if the future is to be acceptable!

For centuries we have believed that we have had the right to exploit nature and all other forms of life as we please and this has been clearly demonstrated by the forces that have moved our society forward and the politicians have had only marginal objections.

The signals from research have been for at least 50 years that humans are just one component of the ecosystem and biological diversity as a whole. There are thankfully deviations from all other forms of life. For example, through our way of thinking and our language, we can rise above the "laws of nature" in different ways and in this way create better conditions for ourselves than the partners with whom we share the earth's resources.

However, we have used these benefits to upset the balance of the system we live in by neglecting our interaction with the whole. We have ignored this whole thing for so long that the reactions have increased from whispers and whispers to a full storm. We have a short time if we are not to suffer from nature's increasingly violent levels of reaction.

People have made many attempts to approach holistic thinking, first of all for our own species through the Convention on Human Rights etc., then through the Convention on Biological Diversity, the Climate Agreement in Paris and finally Agenda 2030 which weaves in the three mentioned conventions and also everything that surrounds us in our everyday lives.

Global efforts are underway to fulfill all these conventions and agreements, targets/*visions*, but absolutely not what is needed happens. Time is far too short and the political will and commitment is too weak to reach the goals in time.

What was the outcome of the climate meeting in **Egypt** 2022?

What can we expect from the climate meeting in **Dubai** with a start 30.11.2023?

In New York an international biodiversity summit will also be held in December 2022.

Halfway through the transition period, the results of the work for an ecologically sustainable society according to the 17 sustainable goals in Agenda 2030 were reported. This took place at a summit in **United Nations headquarters** on 18-19 September 2023.

None of the summits has brought about decisions that can give us hope for an acceptable future.

A future with reduced quality of life will affect us all. The change seems to have already become permanent in many parts of the world. Now it is us world citizens who must participate in slowing down the warming of our fantastic planet.

I have now described our future in two books based on each goal/vision in Agenda 2030 and also when all the goals are met. The connections and the dependencies between the goals are well analyzed and reported, as well as all conceivable obstacles that stand in the way of achieving the described visions.

"Visions save the earth" is 300 pages long.

If you prefer to read in narrative form and draw your own conclusions, the book **"Visions as stories"** is suitable.

It has almost 90 pages of stories about each sustainability goal, when all the goals are met, what prevents us from reaching the goals, a true story how in the 80s we saved all life forms and ends with how we will be able to save it again

Go ahead and use the material, but specify copyright holder with name and email address.

If you think this material can mean something to others, please forward it to others who work for a fair and ecologically sustainable world according to the Agenda 2030 sustainability goals.

They are available in different languages on the website <https://puls62.home.blog/>

Sincerely
Paul Karlsson
