

KEEP LOOKING UP

Your Newest Astronomy News

We have enjoyed another fantastic week here in Astronomy. We performed a lab/demo activity on how and why Jupiter's rings cannot be seen from our own telescopes. That's right, you heard us, Jupiter also has rings. We all know about the magnificent rings of Saturn, but Jupiter also has smaller, fainter rings. See the picture below of the 7B class performing this activity with a small high powered flash light and baby powder. Also check out the really cool picture of the Moon taken by Cayden B. through the clouds. The moon has just left the first quarter phase and is entering the Waxing Gibbous phase. Keep Looking Up!
