

Lesson Topic : How to solve the value of a letter using algebraic equations. (Maths)	
Year Group : Year 7/8	
Learning Outcome	How to solve the value of a letter using algebraic equations.
Links with the New Zealand Curriculum 	Maths Level 3 NZ Curriculum - Know basic multiplication and division facts. Equations and expressions - Record and interpret additive and simple multiplicative strategies, using words, diagrams, and symbols, with an understanding of equality.
Key Competencies 	Managing Self Stay on task when doing my follow up activity, make sure I get it complete and posted on my blog. Relating to others Share my thoughts and learning with the group to get support from others and to support my classmates.
Prior knowledge 	We have worked through the 1st 2 steps of Algebraic equations so my learners have a fairly good understanding on how to solve the equations.
Lesson Sequence 	Session Outline 1. Warm Up. 2. Session Outline 3. Quick Recap 4. Learn new strategy 5. Discussion - who needs more support? 6. Learners work in pairs to solve problems 7. Share learning with group. 8. Complete Activity

Reflection and Analysis

Lesson Content - Lots to reflect on! After teaching this lesson, I was talking with a colleague and realised a better method of teaching this. By explaining to the students, whatever we add or subtract from one side of the equation we have to do to the other side. I'm thinking this would give them a better understanding of how and why we solve these problems. Another thing was that one of the kids had asked during the session what BEDMAS was and why people are talking about it, I took this opportunity to do a quick lesson on what it was and when we have to use it, especially because the next step of algebraic equations is using brackets.

Lesson Pacing - We ended up spending around the same amount of time sharing as we did for the whole lesson, this was great as we had the time to do so, I found this great as students were able to learn and share with each other. I would have normally done this in my 2nd group rotation with that group, had them share.

Lesson Delivery - My learners are loving algebra so much which makes this a lot of fun to teach, they all were really keen on how to solve the more difficult problems. I found myself correcting the groups sharing at the end of the lesson, I was trying to let students do it, however, the teacher inside got the best of me (facepalm) haha.

Student Understanding- I was really impressed with how well our discussions went, because of this I think my learners gained a really good understanding of how to solve these problems. As you could see during the sharing, they are also becoming more confident!
