

1. Open the Warehouse form first.
2. Then open the Units form.
3. Arrange the forms side-by-side.
4. Then click inside the Warehouses listbox repeatedly, to select and deselect rows randomly. As you click, you'll see the Units list update, and all rows get selected. That's the correct behavior.
5. After about 20 clicks, you'll see the Units list begin to display weirdly. Sometimes, it will appear empty. Sometimes, it will update, but nothing will get selected.
6. If the behavior you see never becomes corrupt, then the issue must be a display issue on the developer's computer.
7. View the VBA modules to understand how it works.
8. You can comment out the echo, .visible, and scrollToTop code. On the developer's computer, this will not prevent the display corruption.
