# Making a Screencast using Snagit

In the Chrome web store, there are two entries for Snagit, an app and and extension. You need to get both of them.

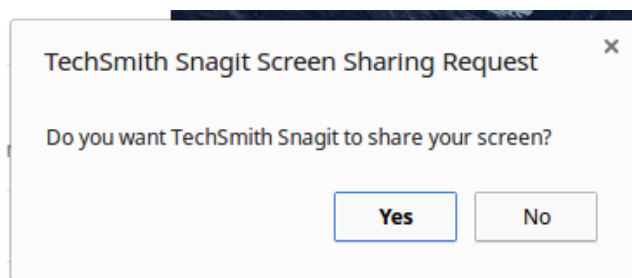

After you have got both of these, open the app and click on the settings wheel. You need to tick the "enable experimental features" option. Once you have done this, the input audio levels bar will be seen and if you make a noise, you will see this pick up the sound.
Now when you open the Snagit app, you will see this box. This will hold all of your screen captures and it has the button to start a new screen cast.

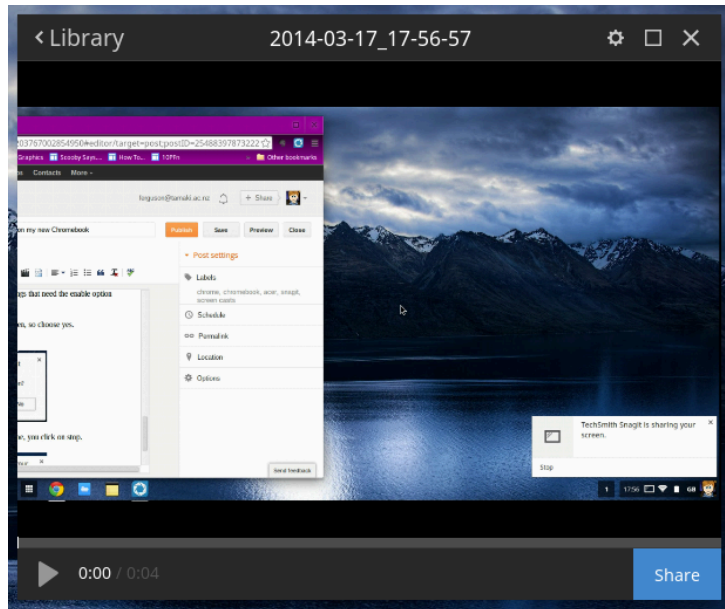

The first time that you do this, it will display a warning box that you need to enable a setting in chrome. It has a link to this so click on through to it. It will take you straight to the settings that need the enable option clicking. Restart chrome and you are ready to go. When you click on new screen recording now, it asks to share your screen, so choose yes. You can then do everything on your screen that you want to record.

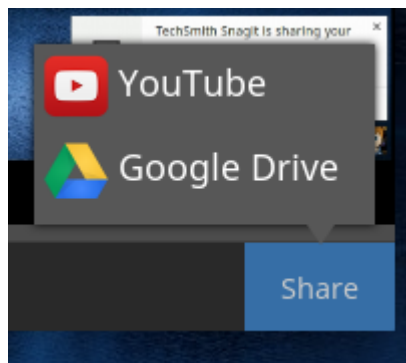

This box is down at the bottom left of your screen, and when you are done, you click on stop.

When you have finished, it will display this box where you can review your recording and see if it is good enough. If you don't like it, just hit the cross to close it and you can start again. You can also choose a file name here, at the top where the date and time is as a placeholder name.

At the bottom, there is a share option and you get to choose from your Google drive or YouTube account.

Here is a link to a site page where I embedded the video that I had saved into my Google Drive.
