Drone Logo Reflection

The tools and resources I used for this project are the design software, Inkscape, and [this](#) youtube video. I followed the instructions in the youtube video to produce my final product. I made the mistake of thinking we had to have the exact same design, and everything would be measured, like the name card project. I spent too long trying to get the exact colors, and eventually, I did. However, after I realized we did not have to have to be exact, the result was not worth the time. I didn't learn many lessons doing this project. My timing was fine, I finished a class ahead of the due date and was in no rush, besides finishing it before I went to bed. My preciseness was one thing I did well. I was more exact than I needed to be. I improve by following the video at a quicker pace. I had to pause the video many times, making it take longer than it could have. The advice I would give is to pay attention, don't miss anything, it will throw you off later, especially with this video. Personally I didn't like the video very much. The video briefly touches some things important things but goes into detail about non-important stuff. It is also confusing and doesn't explain the reasoning for often. He says what the action we are doing does, but not why we should do it. Finally, I like the song he chose for his intro music, but the remix ruined it.
