We have a mixed economy of iPad, Chromebook and PCs like when we first started and now most of our teachers have PCs or laptops in their classrooms. But then we also have iPads for our teachers. Each of our schools has a set of Chromebooks, and then we and we have the iPads as well for the children.

There's also some really great coding programmes that are in browser that we would choose to use the Chromebooks on as well. And I think for us that where our environment is set up, where our teachers and children have Google Logins and usernames. Actually, the handoff between all those different devices is really easy. The teachers can be doing something on their PC and then lift it off on their iPad to teach the children really seamlessly and the same for the children. They can be working on the Chromebook hand something in a Google classroom and view those comments when they take their iPad home from the teacher.
