JOY

JAN. 30, 2022

New Ideas:
1. Suggest other related issues before publishing/submitting the new issue.
   - To avoid discussing the same issue over and over again.
   - I don't know how we can do this but I think when the user adds the tags, the relevant issues will appear on the side.
   - Maybe before submitting the issue, a prompt will show something like ***"Do you want to check these related issues before submitting?"*** or ***"We found a similar issue like yours, do you want to check it out?"***

2. Add tags aside from color coding (not sure if we discussed this already)
   - To categorized them easily
   - Can be used as criteria for identifying its severity

3. Vote feature to move the issue from in progress to solved
   - Just like how the voting works in verifying the issue from the start

4. Put limit on how often a user can comment on issues
   - Having the Top Thinker feature will lead to a great competition– urging everyone to try to comment on every issue, so it is best to set limits.

5. Have the 'Expected outcome/ resolution' when submitting issue
   - To guide the other users on how they can help and to have direction instead of just showing solutions that are not contributing to the end result that the submitter wants.

6. 'Save as draft' feature for submitting and commenting on an issue.
