Climate Action Mapping

The Climate Action Map tool is a place-based map of actions that people are taking to mitigate or adapt to climate change. It's useful because it can quickly and easily help you visualize the climate actions that your community is already taking. It can also help to connect participants to other projects of interest near them building communities of practice.

To use the GIS tool go to: **https://bit.ly/4f9G0WH**
Then fill out the web form that looks like this:

Users will provide an image of the action, a brief written description of the action, and the location of where the action is being taken. More detailed example instructions are available, if you'd like them. **That's it!**

To view the results that are collected, you can browse through the community-led examples. You can sort through the results by location and subtopic (energy/food/transportation).
