# LOS PODERES DE LA IMAGEN

Ensayo sobre cuerpo y muerte  
en la cultura audiovisual

UNIVERSIDAD IBEROAMERICANA

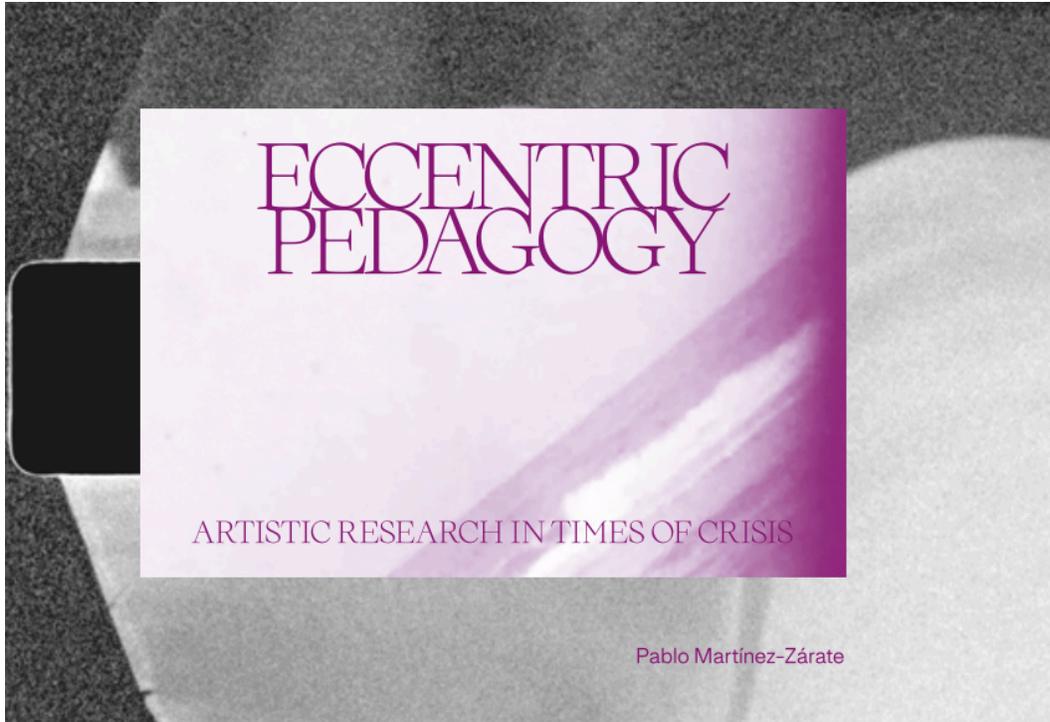

**MÁQUINAS  
PARA VER Y OÍR  
AL LÍMITE DEL TIEMPO**

*Hacia una crítica práctica  
de la comunicación*

Pablo Martínez Zárate

UNIVERSIDAD IBEROAMERICANA

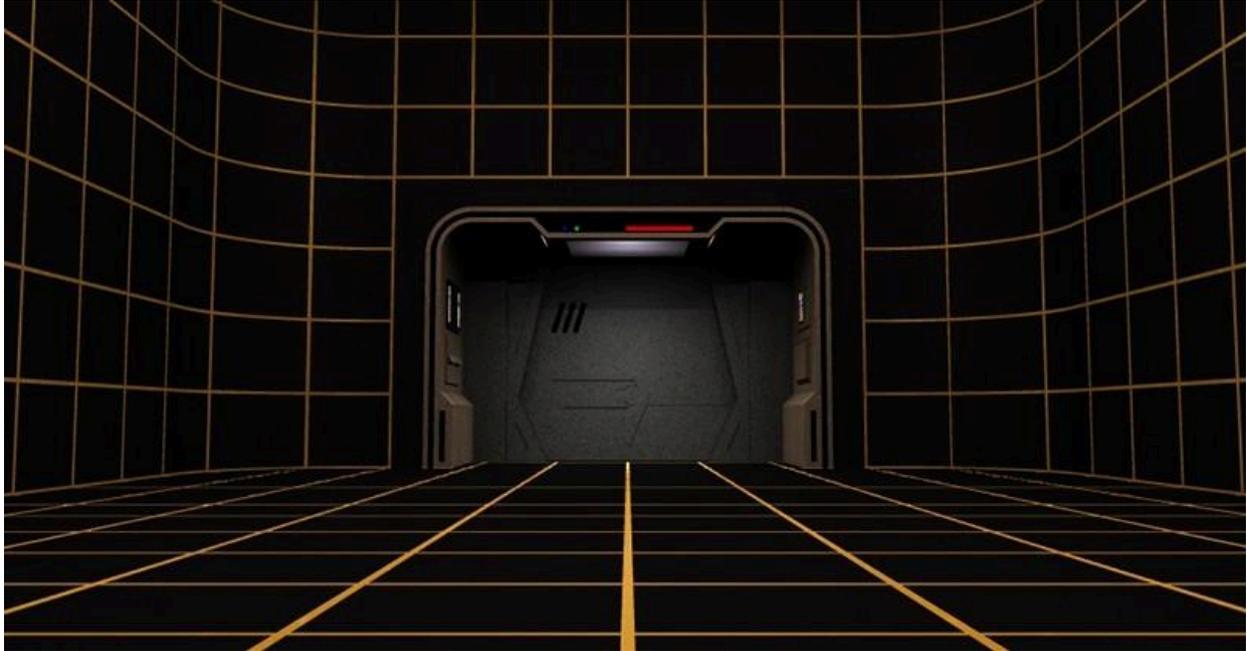

Ejemplos de proyectos:

- El cuerpo es un archivo
- Disecciones sobre planos
- Forensic Landscapes
- Atlas Transgresión

Algunas ideas base:

Inmersión e interactividad

Según Janet Murray, tenemos tres características básicas de la estética del medio digital (holodeck como plataforma):

- Inmersión (siempre habrá una tensión entre fronteras)
- Actuación (lo que más podemos vincular con interactividad -ella habla de modos de placer, juego y recompensa en la inter-acción-, y sus primeras manifestaciones *hipertextuales*)
- Transformación (ella lo asocia con la apariencia, pero tenemos varias formas de interpretar esto, particularmente nuestra capacidad de intervenir lo real)

Concepto clave: hipertexto

In the English translation of Antonin Artaud's collection of essays about the illusion of theatre published in 1938 called 'Theatre and its Double' the translator uses the first coinage the phrase 'virtual reality' in print.

The science fiction author Stanley G. Weinbaum in his novel 'Pygmalion's Spectacles' also described virtual reality simulating real-life sensations in the 1930s.

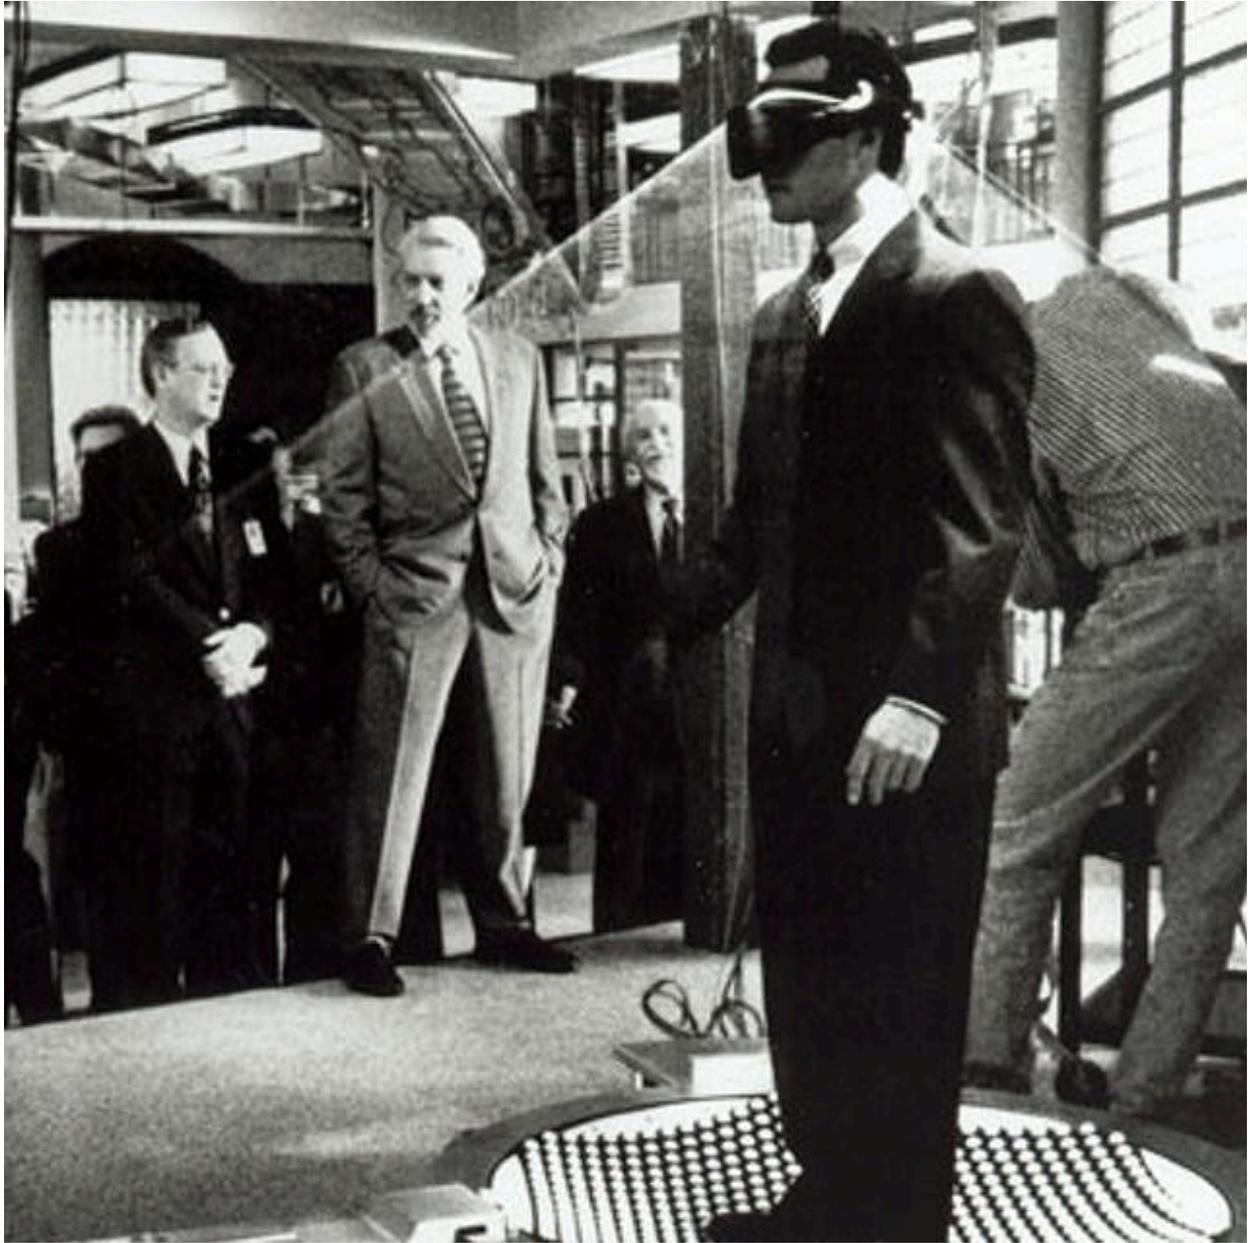

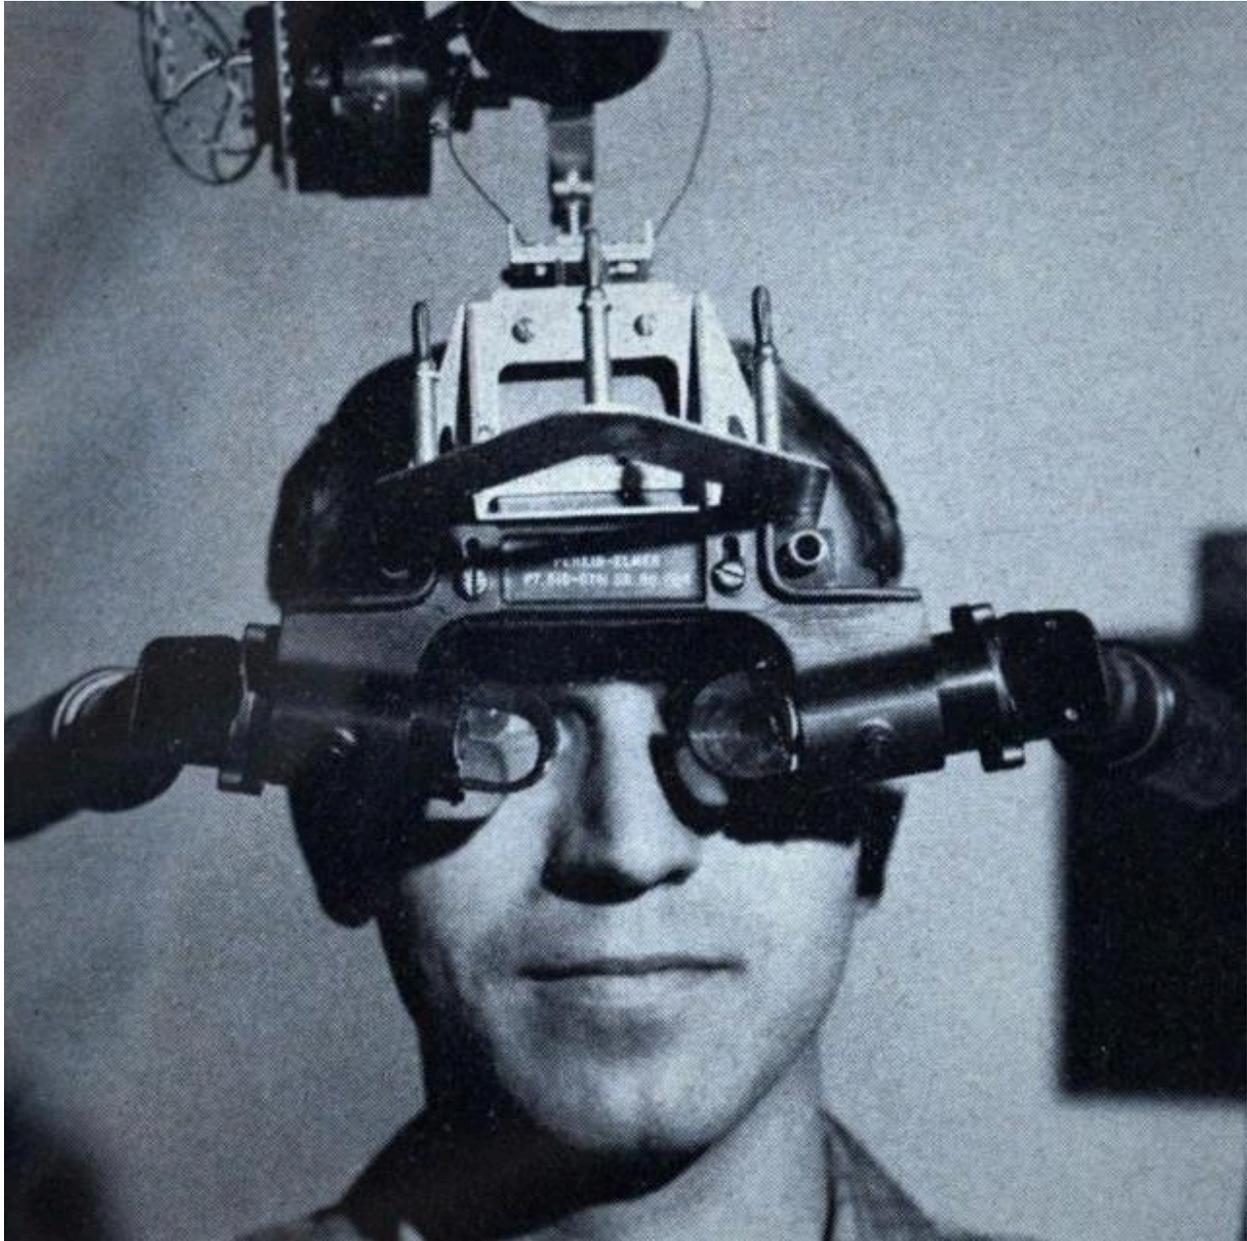

In the 1957 Morton Helig created the first virtual reality experience called the Sensorama his invention was later patented in 1962. The Sensorama was a mini theatre (similar to an arcade game) that would simulate touch, smell and taste. The simulation included a vibrating chair, smell generators, 3D motion

picture and wind and constituted a major breakthrough in virtual reality design.

The Telesphere Mask was the first head-mounted display however this was not interactive. The VR headset gave the user Stereoscopic vision and sound and may have been the blueprint foSutherland's later headset.

The 1960's marked a new dawn for VR headsets. Two engineers Comeau and Byran developed the HDM to include a motion tracking system. The headset also had a video screen which was linked to a camera system in 1961. This system was dubbed 'The Headsight'

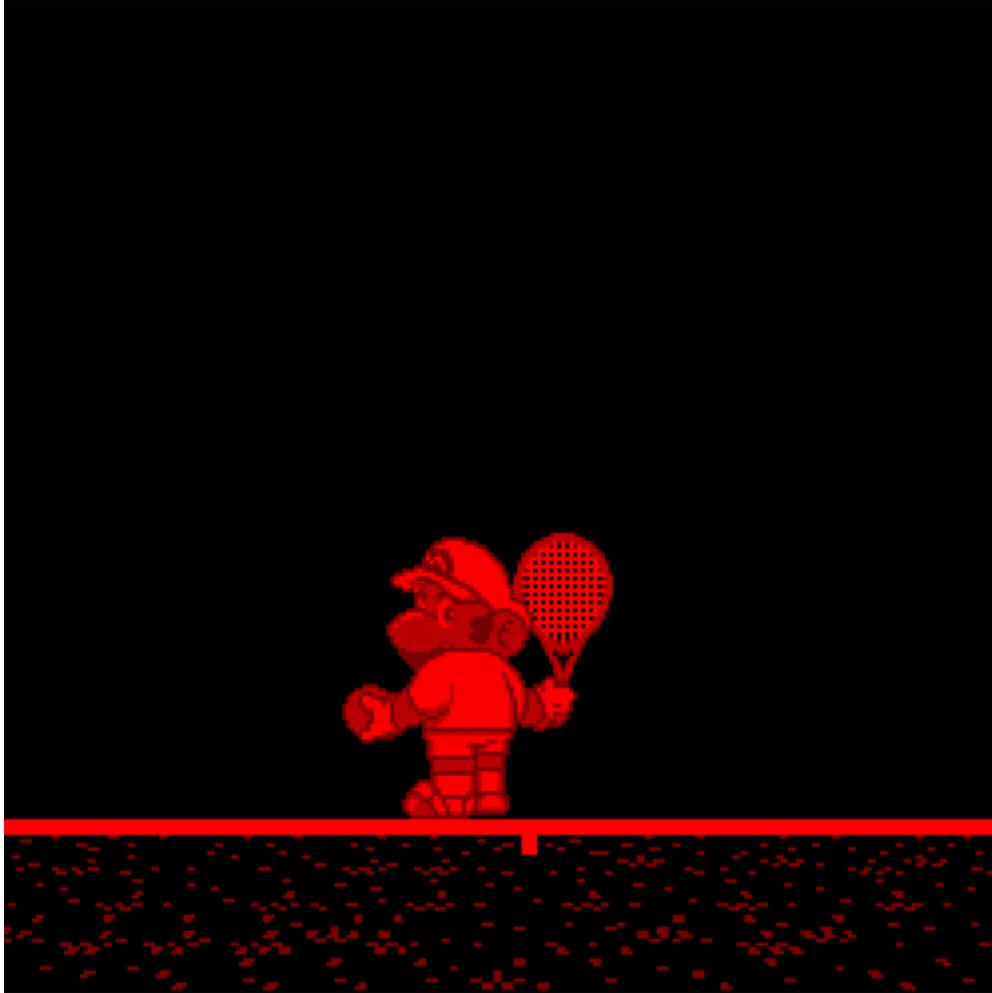

Next Ivan Sutherland formed his 'Ultimate Display' concept which provided a framework for VR development as software that simulated real-life environments which users could interact with. A few years later in 1968 Sutherland invented the first augmented reality head-mounted display (HMD) called the Sword of Damocles, commonly called virtual reality glasses. This HMD used computer output and stereoscopy to create depth of vision. This model was so cumbersome that it had to be suspended from the ceiling so the user to wear the HMD. The virtual environment shown on this system were simple rooms.

In 1969 whilst studying at university, Myron Kruegere created artificial reality several environments using computer software collaborating with other computer science professionals. 'Glowflow' was one of these

early programmes which featured light and sound which responded to users in the environment. The projects would contribute to Kruegere's break-through project 'Videoplace' which gained recognition in the USA and Japan.

Virtual Reality gathered speed in the late 80s as Janon Lanier popularised the phrase 'virtual reality'. Lanier's company was the first company to sell Virtual Reality glasses ('EyePhones') and thus they catapulted the capabilities of VR into the public eye.

The Nintendo

Virtual Boy was set to become the world's first portable VR games console success but the limited colour display meant that sales were poor. As a result the Virtual Boy was discontinued worldwide after just one year of sales and was the second-lowest Nintendo console.

In 1999 The Matrix film series put the capability of VR back into the realm of popular culture. The film creates a simulated world 'The Matrix' which simulates the real world so closely some characters are not aware that they are in this virtual world at all.
