

### Lab 2.7: Network Configurations (RIP routing protocol)

Setup a network similar to the one in the diagram. Any router that meets the interface requirements displayed in the above diagram, such as 800, 1600, 1700, 2500, 2600 routers, or a combination, may be used.

#### Step 1. Adding RIP routing protocol.

- In global configuration mode , add RIP route on Router0 to network 200.0.3.0 and on Router1 to network 200.0.1.0

Router0(config)#\_\_\_\_\_

Router0(config-router)#\_\_\_\_\_

Router0(config-router)#\_\_\_\_\_

Router1(config)#\_\_\_\_\_

Router1(config-router)#\_\_\_\_\_

Router1(config-router)#\_\_\_\_\_

#### Step 2. Verify the new route

- Use the command **show ip route** , view the IP routing table for Router0 and Router1.

What are in the IP routing table for Router0?

---

---

---

What are in the IP routing table for Router1?

---

---

---

- What network that Router0 learn from EIGRP routing protocol?

---

---

---

**Step 3.** Save the router configuration

```
Router0# copy running-config startup-config  
Router1# copy running-config startup-config
```

**Step 4.** Using ping command to verify routes from PC1.

| Destination | Success (y/n) |
|-------------|---------------|
| 200.0.1.1   |               |
| 200.0.2.2   |               |
| 200.0.3.1   |               |
| 200.0.3.2   |               |

**Step 5.** Using ping command to verify routes from PC2.

| Destination | Success (y/n) |
|-------------|---------------|
| 200.0.3.1   |               |
| 200.0.2.1   |               |
| 200.0.1.1   |               |
| 200.0.1.2   |               |

**Step 6.** Remove RIP routes on Router0 and Router1.

Router0(config)# \_\_\_\_\_

Router1(config)# \_\_\_\_\_

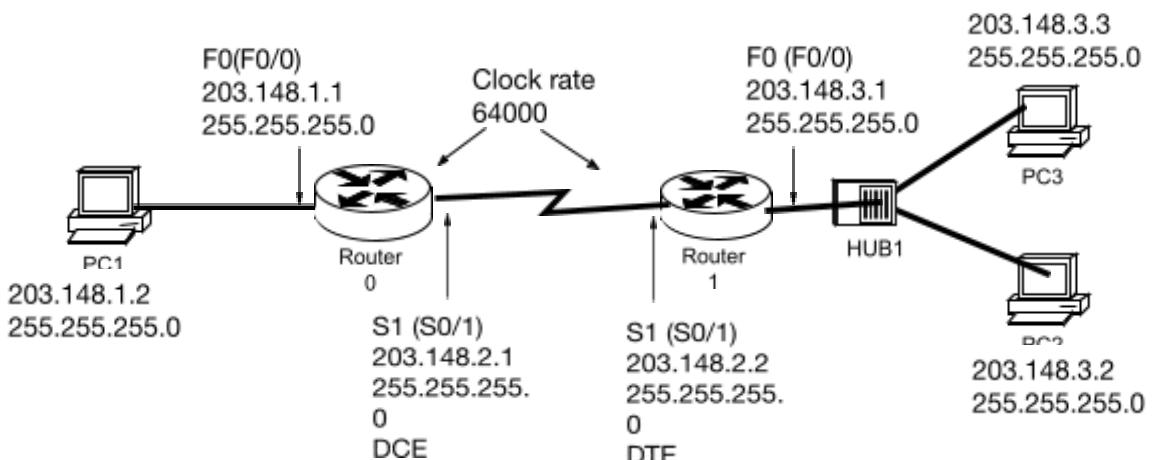

Try to ping from PC1 to PC2 , success or not ?(y/n)\_\_\_\_\_

**Step 7.** Remove the startup-config

```
Router0# erase startup-config  
Router1# erase startup-config
```

**Step 8.** Restart the router

```
Router0# reload  
Router1# reload
```

**Lab 2.8 : Network Configurations (EIGRP routing protocol)**

Setup a network similar to the one in the diagram. Any router that meets the interface requirements displayed in the above diagram, such as 800, 1600, 1700, 2500, 2600 routers, or a combination, may be used.

**Step 1. Adding EIGRP routing protocol. AS number 100**

- In global configuration mode , add EIGRP routing protocol on Router0

Router0(config)#\_\_\_\_\_

Router0(config-router)#\_\_\_\_\_

Router0(config-router)#\_\_\_\_\_

- In global configuration mode , add EIGRP routing protocol on Router1

Router1(config)#\_\_\_\_\_

Router1(config-router)#\_\_\_\_\_

Router1(config-router)#\_\_\_\_\_

**Step 2. Save the router configuration**

Router0#\_\_\_\_\_

Router1#\_\_\_\_\_

**Step 3. Verify the new route**

- Use the command **show ip route** , view the IP routing table for Router0 and Router1.

What are in the IP routing table for Router0?

---

---

---

What are in the IP routing table for Router1?

---

---

---

What network that Router0 learn from EIGRP routing protocol?

ชื่อ \_\_\_\_\_

รหัส \_\_\_\_\_

What network that Router1 learn from EIGRP routing protocol?

---

**Step 4.** Using ping command to verify routes from PC1.

| Destination | Success (y/n) |
|-------------|---------------|
| 203.148.1.1 |               |
| 203.148.2.2 |               |
| 203.148.3.1 |               |
| 203.148.3.2 |               |

**Step 5.** Using ping command to verify routes from PC2.

| Destination | Success (y/n) |
|-------------|---------------|
| 203.148.3.1 |               |
| 203.148.2.1 |               |
| 203.148.1.1 |               |
| 203.148.1.2 |               |

**Step 6.** Remove EIGRP routing protocol on Router0 and Router1.

Router0(config)# \_\_\_\_\_

Router1(config)# \_\_\_\_\_

Try to ping from PC1 to PC2 , success or not ?(y/n)\_\_\_\_\_

**Step 7.** Remove the startup-config

Router0# erase startup-config

Router1# erase startup-config

**Step 8.** Restart the router

Router0# reload

Router1# reload
