

Full case story

-

I begin with the current and permanently interesting information about the official status of the bromelain enzyme with representatives of medicine, pharmacies, physiotherapists and other institutional exponents of the pharmacomedical fiefdom.

[Bromelain purchase](#)

[Bromelain enzyme - wikipedia](#)

[Anticancer properties of bromelain: State-of-the-art and recent trends](#)

The presented links show us that this enzyme of vegetable origin has a commercial, encyclopedic and scientific status. I asked about 5 - 7 doctors, a few pharmacists, and a similar number of nurses and physiotherapists - therapists for their opinion on the possible use for a person with brain tumors.

Dear reader of this text, isn't it strange that none of the respondents have ever heard or read about this enzyme, which may be one of the complementary solutions for oncology patients, especially in case of tumor metastases. The enzyme has no side effects. It does not maim or kill the patient, as e.g. medically approved therapies.

I will not reveal more details for now in order to protect the interests of those involved, especially the person with an oncological status. But surely we are only at the very beginning of our story, my handwritten diaries are waiting for me to review, edit and write them down in the present document. But we can expect a lot of new things in this story.

-

Unfortunately, the treated person died in the summer of 2024.

-

An overview of the circumstances and possible causes of alternative treatment failure.

The personal doctor initially makes the wrong diagnosis, and critical time is lost.

When the cancer was first medically diagnosed, it had already metastasized throughout the body.

Very aggressive 'turbo' cancer after vaccination with Astrazeneca based on carcinogenic adenoviruses.

An ugly family conflict shocks the treated person, followed by a pleural effusion. My spontaneous visualization during that period shows a graphite black darkening of one half of the lung. It is also possible to assume an inflammatory effect of graphene from the vaccine on the lungs of the treated person.

Too many different metastatic cancers in too many different places make it difficult and impossible to effectively use Grabovoi's treatment technologies. As a result, the spread of cancer is faster than the effects of alternative treatment.

Chemo - immuno - radio therapy causes fatal damage to health, but does not stop cancer. Immunotherapy also excludes some alternative phytotherapies. Affirmed prognoses of cancer kill hope, especially explicitly informing a sick person about the incurability.

The most fatal consequence of orthomedical radio-chemo-immunotherapy is immobility, which follows the resulting symptomatic epilepsy. Oxygen is a cancer killer. Immobility, however, reduces oxygenation of cells, which allows the unhindered growth and spread of cancer.

Possible repressed psychological escape from difficult family coexistence.
