**THIS DOCUMENT IS OUTDATED:** Most of (hopefully all of) this information can now be found in the "External Tools" section of our API docs:

https://canvas.beta.instructure.com/doc/api/index.html

I will keep the information below as an Archive.

IMPORTANT NOTE: This is not official Canvas documentation. Official docs can be found here in the External Tools section: <a href="https://canvas.beta.instructure.com/doc/api/index.html">https://canvas.beta.instructure.com/doc/api/index.html</a>

### Intro:

If you'd like to begin developing against the Canvas LTI 1.3 + Advantage feature set, this guide should help you get started:

Beyond understanding the spec, which is where most of the documentation lies, you'll need to know a few things specific to Canvas.

The feature flag for LTI 1.3 has been removed, so the following flow is available to all cloud-deployed accounts. You can do the following to configure an LTI 1.3 tool:

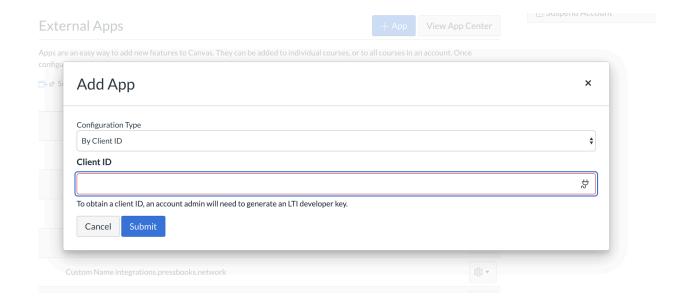

- 1) In the /accounts/self path, click "Developer Keys"
- 2) Click "+Developer Key" → "+LTI Key"
- 3) LTI 1.3 Configuration: Supply the configuration JSON. Here's an example:

```
"title": "IMS LTI RI",
"scopes":[
  "https://purl.imsglobal.org/spec/lti-ags/scope/lineitem",

                  "module id": "$Canvas.module.id",
                  "foo": "$Canvas.user.id"
         "target link uri": "https://lti-ri.imsglobal.org/lti/tools/281/launches",
         "oidc initiation url": "https://lti-ri.imsglobal.org/lti/tools/281/login initiations"
```

- 4) Redirect URI and login initiation: The initial launch is part of an oidc third-party flow. Tools are expected to send back a response with a state to a well known endpoint in Canvas to <a href="mailto:initiate">initiate</a> login. Canvas will send https://canvas.instructure.com as the iss. So once you get the initial launch you should be sending back a payload to
- 'https://canvas.instructure.com/api/lti/authorize\_redirect` via a GET or POST (the domain should always be canvas.instructure.com). Canvas will then do what in 1.1 is usually called the "LTI Launch" by redirecting back via a form post in the User Agent to the endpoint specified in the Developer Key Redirect\_uri field. The target\_link\_uri is then used on your side if you want to do yet another redirect, Canvas does nothing with it but pass it along.
- 5) Once configured, save the key and review the configuration. Admins can adjust the configuration if they want to disable any services before finalizing. **NOTE:** Currently, after saving, you must delete and re-add the tool if you want to adjust these settings.
- 6) Turn on the new key. Turning on the dev key finalizes the tool registration, but still it needs to be turned on for the account.
- 7) To turn on the tool, Go to  $/accounts/self \rightarrow settings \rightarrow apps \rightarrow View App Configurations (top right) <math>\rightarrow$  +app  $\rightarrow$  By Client ID  $\rightarrow$  paste developer key ID from above steps.

## FAQ:

Q: Where do I find the **Public Keys**?

A: https://canvas.instructure.com/api/lti/security/jwks

Note that these keys are rotated, so you should check this frequently. Each environment has it's own set of keys. <a href="https://canvas.beta.instructure.com/api/lti/security/jwks">https://canvas.beta.instructure.com/api/lti/security/jwks</a> and <a href="https://canvas.test.instructure.com/api/lti/security/jwks">https://canvas.test.instructure.com/api/lti/security/jwks</a>. You can also access these from any \*.instructure.com domain, but they are currently the same set of keys across all domains.

Q: How do I access the LTI Advantage Services via OAuth2?

A: Refer to the OAuth2 API docs here:

https://canvas.instructure.com/doc/api/file.oauth.html#accessing-lti-advantage-services

### Release notes:

7/2/2019: added better description of how to use LTI advantage services in FAQs.

6/25/2019: We have some official release notes!

- BETA: Line items have been extended to support creating an assignment that launches back out to your tool! <a href="https://canvas.beta.instructure.com/doc/api/line\_items.html">https://canvas.beta.instructure.com/doc/api/line\_items.html</a>. This lets you create external\_tool submission type assignments without the teacher having to manually create them. Cool!
- BETA: we now send the correct taget\_link\_uri in the id\_token when a launch occurs from a deep linked resource

6/7/2019: Some Canvas docs added to beta:

line items: <a href="https://canvas.beta.instructure.com/doc/api/line">https://canvas.beta.instructure.com/doc/api/line</a> items.html

results: <a href="https://canvas.beta.instructure.com/doc/api/result.html">https://canvas.beta.instructure.com/doc/api/result.html</a>
Score: <a href="https://canvas.beta.instructure.com/doc/api/score.html">https://canvas.beta.instructure.com/doc/api/score.html</a>

Names and Roles: <a href="http://canvas.docker/doc/api/names">http://canvas.docker/doc/api/names</a> and role.html

#### 6/4/2019:

Current bug with Advantage services: Please enable the "Beta and Test Access For Students" if you want to use AGS or NRPS in beta. Tools working in beta/test will get a 401 error when attempting to use a client\_credetials grant token if the "Beta and Test Access For Students" setting is disabled in the account. Canvas attempts to check this setting against a user, but since the client\_credentials grant has no user, the check for this setting fails, giving a 401.

**5/13/2019:** There was a mistake in the example JSON below. The "url" field within a placement has been updated to be "target\_link\_uri" in the example. This should allow for placement-specific launch url's

**5/13/2019: BETA update:** Updated step 7; UI for enabling a tool (in beta) has changed to require a developer key ID for installation. Manual configuration should now be usable. Deleting developer keys should now clean up any installed tools associated with the key. Disabling a developer key **will not yet** soft-delete and associated tools. Re-enabling a developer key **will not yet** re-activate previously installed tools.

**5/6/2019:** Updated step 7; UI for turning on the tool configuration after enabling a developer key was changed. We will be updating this again in the next release or 2 as well.

**4/20/2019:** Manual Configuration UI is not completed. You should now see an option for a manual LTI 1.3 dev key configuration in BETA, however, **the backend work for this is not complete**, so please ignore this option for now.

Iti11\_legacy\_user\_id has been removed as per the LTI 1.3 spec

Deep linking should now work in BETA in the assignment\_selection placement

**4/1/2019:** The new field name "oidc\_initiation\_url" now replaces "oidc\_login\_uri". You will want to update your JSON schema accordingly.

Clarified step 4 so that it's clear that authorization payload always goes to <a href="https://canvas.instructure.com/api/lti/authorize\_redirect">https://canvas.instructure.com/api/lti/authorize\_redirect</a> (i.e. the domain is always canvas.instructure.com).

3/11/2019 NOTE: JSON Schema is updated in this doc. Please see new example below.

# Changes:

- 1) settings now has an array field called placements and each value inside of placements is the usual hash but with a key called placement that is the value of the placement
- 2) launch\_url has been renamed to target\_link\_uri

Upcoming changes: oidc\_login\_uri will be renamed to oidc\_initiation\_url
