Let Ultradox do the work for you!

Welcome! If you want to learn more about using Ultradox, you've come to the right place.

With Ultradox you can [automate your business](#) by creating a flow of building blocks that orchestrate your apps.

While Ultradox has been designed and created in the first place to [generate, print and send nice looking documents](#), it is not limited to document generation.

Ultradox also handles [approval flows](#) involving multiple users, complex email campaigns including timed follow-up emails and rapid creation of [mobile-ready progressive web apps](#).

We do the heavy lifting for you so that you can focus on your business requirements.

Release Notes

August 26th, 2024 Support of Google Sheets with multiple columns with the same header name. Effective variable names for columns with the same name can be configured in the <code>Load row(s)</code> or <code>Load worksheet</code> building block. Bugfix in filtering lists with string using the "Not equals" operator.	August 3rd, 2022 Ultradox now seamlessly supports shortcuts to folders on Google Drive. You can open shortcuts to folders in the file picker just like folders. When listing files in a shortcut to a folder, Ultradox will automatically resolve the shortcut and list the files in the target folder if you have acces.
January 25th, 2023 The stripe building block supports handling of asynchronous payments like SEPA. The if/else blocks to execute subsequent blocks based on the payment status can be added using the button in the suggested action section in the stripe block on the right hand side. This allows you for example to send out an email when the payment started and another email when the payment finally succeeded, probably after a few days.	July 16th, 2022 String renderer now supports negative values in <code>from</code> and <code>to</code> parameter to get a substring from the end of the string. <code>Upload</code> method in Webhook building block now supports additional parameters to be passed along with the file. It will create a multipart form request and encode the file and parameters in the body of the request. Download block in the Google Drive section now allows to specify the MimeType of the

	downloaded file. This will for example allow you to download a Google Sheet in Excel format.
