Chapter 10: Misfit Shenanigans

Fast forward to 2024 when Brad Yayger was doing battle against the Naval Misfits with Operation Bonehead. Brad was rather frustrated with the beta test program for the I.T.C. (pronounced "Itsee") brain-computer interface (B.C.I.) technology. There were on-going efforts on the part of the Misfits to substitute their own brain-control system technology for the international civilian technology. They had thoroughly deceived personnel at both QualCum and B.T.&T. that their technology was viable. It would fall flat on its face out of the starting gate.

They had also been deceived on the nature of Brad's wisdom school work. Misfits convinced them that it was a criminal racket. The irony here is astronomical because there has never been a bigger criminal racketeering organization than the Misfits. They had been a horrific blight on humanity for centuries. Brad considered them to be spit-and-polish pirates. That assessment is an insult to genuine pirates.

Brad's work with Misfit interference was nothing short of heroic. He stunned test staffers with his adept assessments and problem solving skills. His efforts to put the visualization system through its paces helped to demonstrate the extraordinary integrity of I.T.C. technology and the shabby quality of B.T.&T. imaging. The latter depended heavily on image processing. The former does not. It simply replicates an individual's neural imaging waveforms in the heads of the recipients. The only component that Brad's gyrations and sudden moves exercised was the neural tracking technology. That had been rigorously tested in-house long before Brad used it.

This could not be said of the B.T.&T. imaging, which was rushed into the field without proper qualification. It broke immediately and thoroughly. There was no sense continuing to work with it. The Misfits insisted on shoe-horning antiquated Mooderola imaging into the test environment. Despite QualCum objections to an obvious regression, B.T.&T. management backed up the Misfits. The fact that there was zero engineering support for the Mooderola machine became a huge embarrassment for the managers.

Use of antiquated image technology with QualCum staff exposed Brad and the Get Fresh Crew to the criminal aspects of brain-control systems. This included masking techniques that partially crippled its victims. Some of the QualCum staff had been crippled for over a decade. Many of the I.T.C. engineers had jumped ship at Mooderola over the fact that they had been deceived into believing masks were reversible and limited to test usage. They were appalled that test staff had suffered long-term crippling. The masks can be undone electronically, but had been left in place by corrupt test managers. When test staff attempted to unmask testers after a run, managers threatened them with reprisals. Competent staffers walked away from such duress. Incompetent ones stuck to the job.

Brad suspected that the masks could be cleared with physical therapy. Some of the engineers were skeptical because they were unaware of the underlying neural cauterization that implemented masking. Better informed engineers had witnessed spontaneous mask clearing and got a simple explanation from staff neurologists. Exercising the nervous system would deprogram the mask. It just seemed to be "spontaneous." This information had been classified as a "state secret" until a Federal court ruled that Misfit use of the technology qualified as a crime against humanity. When Naval lawyers insisted that the

technology needed to remain classified, the presiding judge insisted on a rationale for doing so. They could make no argument in that regard.

When Brad encountered a man with a reverse focal point mask, he told the test support staff to leave it in place as he worked with the mask victim to clear the mask. The mask blacked out the victim's non-focal visual field, but only for internal visualization. It caused a gauzy effect on the external visual field. It was only one of a set of crippling effects induced by an old Mooderola machine developed in the '90s to Misfit specifications. Brad referred to it as a "boning device" because it crippled its victims to the point of being as stupid as a white power guy (a bonehead).

Brad had the victim perform eye exercises in an effort to clear the mask. It worked. He then went on to test for other crippling masks, especially sensory masks. They were all there and they all melted away with physical therapy. He was aware of the sense of balance. Exercising the balance system to clear balance masks was the most impressive of Brad's "deboning" techniques. Many experienced I.T.C. engineers had been blind-sided because the sense of balance was not included in their Biology classes.

Brad and the Crew discovered that some people could be "reboned" using the Mooderola machine, while others were immune. One of the more significant differences was in the application of multi-tiered tagging. I.T.C. engineers traced the distinction to the level of mobile connectivity. People with a multi-tiered tag had been upgraded to 3G mobile. They could no longer be connected to the 2G Mooderola device. Multi-tier tagging became a standard tool for deboning Misfit victims. This frustrated the hell out of them.

Brad had developed multi-tier tagging as a way to reinforce a story. The core story was layered with the story of the story. This was subsequently layered with the story of the story of the story. It worked brilliantly. An educator included the technique in her Junior High School English course work. It boosted student performance to an extraordinary degree.
