	Unit I
<u>Overarching Theme</u>	Functions, Equations, and Solutions
<u>Power/Anchor Standards and Evidence of Learning</u> Non-negotiable Suggested	<p><u>Section 1 - Equations</u></p> <p>8.EE.C.7 - Solve linear equations in one variable.</p> <p>8EE.C.7a - Give examples of linear equations in one variable with one solution, infinitely many solutions, or no solutions. Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form $x = a$, $a = a$, or $a = b$ results (where a and b are different numbers).</p> <p>8.EE.C.7b - Solve linear equations with rational number coefficients, including equations whose solutions require expanding expressions using the distributive property and collecting like terms.</p> <p><u>Math Practices</u> MP.5 Use appropriate tools strategically. MP.6 Attend to precision.</p> <p><u>Section 5 - Systems of Linear Equations</u></p> <p>8.EE.C.8 - Analyze and solve pairs of simultaneous linear equations.</p> <p>8.EE.C.8a - Understand that solutions to a system of two linear equations in two variables correspond to points of intersection of their graphs, because points of intersection satisfy both equations simultaneously.</p> <p>8.EE.C.8b - Solve systems of two linear equations in two variables using the substitution method, and estimate solutions by graphing the equations. Solve simple cases by inspection. For example: by inspection, conclude that, $3x + 2y = 5$ and $3x + 2y = 6$ have no solution because $3x + 2y$ cannot simultaneously be 5 and 6. Solve using the substitution method.</p> <p>Unpacked: $3x + 2y = 5$ and $3x + 2y = 6$ have no solution because $3x + 2y$ cannot simultaneously be 5 and 6.</p>

Deptford Township Public Schools Curriculum Template

Subject: Mathematics

Grade: 8th

8.EE.C.8c – Solve real-world and mathematical problems leading to two linear equations in two variables.

Unpacked: given coordinates for two pairs of points, determine whether the line through the first pair of points intersects the line through the second pair.

MP.1 Make sense of problems and persevere in solving them.

MP.2 Reason abstractly and quantitatively.

MP.6 Attend to precision.

MP.7 Look for and make use of structure.

Section 6 – Functions

8.F.A.1 – Understand that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs consisting of an input and the corresponding output.

(Clarification: Function notation is not required in Grade 8)

MP.2 Reason abstractly and quantitatively.

MP.5 Use appropriate tools strategically.

8.F.A.2 – Compare properties (e.g. rate of change, intercepts, domain and range) of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions).

Unpacked: given a linear function represented by a table of values and a linear function represented by an algebraic expression, determine which function has the greater rate of change.

MP.5 Use appropriate tools strategically.

MP.8 Look for and express regularity in repeated reasoning

8.F.A.3 – Interpret the equation $y = mx + b$ as defining a linear function, whose graph is a straight line; give examples of functions that are not linear.

Unpacked: the function $A = s^2$ giving the area of a square as a function of its side length is not linear because its graph contains the points (1,1), (2,4) and (3,9), which are not on a straight line.

Deptford Township Public Schools Curriculum Template

Subject: Mathematics

Grade: 8th

MP.2 Reason abstractly and quantitatively.
MP.3 Construct viable arguments and critique the reasoning of others.
MP.5 Use appropriate tools strategically.

8.FB.4 - Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two (x, y) values, including reading these from a table or from a graph. Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of its graph or a table of values.

MP.6 Attend to precision.
MP.2 Reason abstractly and quantitatively.
MP.7 Look for and make use of structure.

8.FB.5 - Describe qualitatively the functional relationship between two quantities by analyzing a graph (e.g., where the function is increasing or decreasing, linear or nonlinear). Sketch a graph that exhibits the qualitative features of a function that has been described verbally.

MP.1 Make sense of problems and persevere in solving them.
MP.2 Reason abstractly and quantitatively.
MP.4 Model with mathematics.
MP.5 Use appropriate tools strategically.

Grade: 8th

Section 8 - Volume and Similar Solids

8.G.C.9 - Know the formulas for the volumes of cones, cylinders, and spheres and use them to solve real world and mathematical problems. **Students may solve real-world mathematical problems involving the physical properties of the principle gasses that cause climate change molecules.**

Statistics and Probability

8.SP

A. Investigate patterns of association in bivariate data.

- Construct and interpret scatter plots for bivariate measurement data to investigate patterns of association between two quantities. Describe patterns such as clustering, outliers, positive or negative association, linear association, and nonlinear association. Students may investigate patterns of association in bivariate data involving the amount of greenhouse gas in the atmosphere and its effect on temperature.
- Know that straight lines are widely used to model relationships between two quantitative variables. For scatter plots that suggest a linear association, informally fit a straight line, and informally assess the model fit (e.g. line of best fit) by judging the closeness of the data points to the line.
- Use the equation of a linear model to solve problems in the context of bivariate measurement data, interpreting the slope and intercept. For example, in a linear model for a biology experiment, interpret a slope of 1.5 cm/hr as meaning that an additional hour of sunlight each day is associated with an additional 1.5 cm in mature plant height. Students may use the equation of a linear model to solve problems in the context of bivariate measurement data, interpreting the slope and intercept involving the physical properties of the principle gasses that cause climate change.
- Understand that patterns of association can also be seen in bivariate categorical data by displaying frequencies and relative frequencies in a two-way table. Construct and interpret a two-way table summarizing data on two categorical variables collected from the same subjects. Use relative frequencies calculated for rows or columns to describe possible association between the two variables. For example, collect data from students in your class on whether or not they have a curfew on school nights and whether or not they have assigned chores at home. Is there evidence that those who have a curfew also tend to have chores?
