Search Results: sorts and filters

Which sorts and filters do we need on the search results page and which ones should we strive to have in our MVP?… Filters narrow the search results (generally based on ranges), whereas sorts sort the results. (Sorts may not even be necessary with good filters)

Filters

- Crop/Category
  - species
  - variety
  - cultivar
  - etc
- Sow time (filter by date range)
- Intensiveness (filter by intensity)
- Compatibility (filter by range)
- pH (filter by range)
- Growing Location (discrete: greenhouse, outdoors, indoors, potted?)
- Time Commitment (discrete: high, medium, low)

I imagine anything that can be a Prerequisite could also be a filter (for people who are not logged in and do not have a compatibility score) - Rory

Sorts

- compatibility - default sorting for guides
- crop - guides grouped by crop, groups sorted by number of guides?
- popularity - guides sorted by popularity
- newness - probably not useful as a sort, rather newer guides could just be marked new
- sow time
- intensiveness
-
