

BlackCoin

The currency of the future.

Blackcoin is the most advanced currency ever - in terms of security and simplicity. But that's not all. We created a currency free from government intrusion, borders and taxes . It's money for a modern world. It's fast, secure and free - the way money should be.

What makes BlackCoin the world's most advanced currency?

BlackCoin is a model for the next generation of digital currencies. BlackCoin changes the game with something called proof-of-stake. BlackCoin takes Bitcoin to the next level in the way it secures its network.

Proof-of-stake provides for much faster transaction speeds and enhanced security. Not to mention, there's no reliance on fancy hardware or mining equipment as with Bitcoin. Every BlackCoin user - from grandmothers to tech savvy youth - has the same ability to use the digital currency.

It's money for the modern world, and a currency you can count on.

It's money. That makes cents.

Earn money simply by keeping your wallet open. Receive 1% compounded yearly interest for your part in keeping the network safe, through a process called staking.

Modern money.

Security you can bank on, without a bank. Send and receive secure payments with friends, family, and merchants anywhere in the world without the need for a central authority or bank.

Too smart to fail. BlackCoin is a peer-to-peer digital currency with a distributed, decentralized public ledger; that unlike ones held at traditional banks, are viewable and easily audited by anyone. There is no wizard behind the curtain.

Safer than a safe.

For the people. By the people. BlackCoin's innovative proof-of-stake system means your money is secured by each and every person staking with a BlackCoin wallet, instead of a few large miners like Bitcoin does.

Instant. It's about time.

It's faster than Bitcoin. Really fast. BlackCoin's faster confirmation times mean faster check out times at merchants worldwide, and allows people to send and receive fast, easy and secure payments with friends and family anywhere in the world.

The most energy efficient currency ever.

With no wasteful mining, BlackCoin uses far less energy than most digital currencies. The network is based on simple computers and phones owned by BlackCoin users all over the world. Coins built on other systems such as Bitcoin, depend on centralized complicated energy-hungry hardware.

Meet Black.

First, you need to get a wallet to store your BlackCoins.
