

Commander: GammaMetroid in the Aviflora

Experimental information:

15 Mar 3310

All is set for Canon's "Project Guardian Lighthouse" tomorrow afternoon. I returned to Thompson Dock today to change out my Type 9, the Bull Netch, for the more nimble Phantom "Aviflora." And I am glad I did, I had gotten used to the Type 9 but the difference in speed and maneuverability of the Aviflora never fails to disappoint! I arrived at SYNUEFE DK-P C22-35 and located the Guardian Beacon orbiting SYNUEFE DK-P C22-35 3 and conducted a dry run of beacon activation at about 8:15 PDT. All appears consistent with the other beacons I have seen. Upon approach, the pylons extend, revealing their energy collectors. Energizing them with a laser powers the beacon, causing it to open fully, revealing the orb inside. Scanning the orb provides a Guardian key. Now to settle in for the night and get ready for the group effort tomorrow.

Experimental Results:

16 Mar 3310

Coordinated beacon activation was successful! No unusual reactions are immediately apparent, so we will have to wait and see if any delayed effects will manifest.
