#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bangalore- 560090

GENERAL INSTRUCTIONS

1. Perform only appropriate experiments and be sure that you understand the procedure involved before you begin.
2. Energize the circuit only after getting approval from the faculty-in-charge.
3. Do not modify equipment settings unless instructed by lab handout or lab instructor.
4. Unauthorized experiments and working in the laboratory outside the class hours without permission are strictly prohibited.
5. Keep bags in the designated areas.
6. If you feel unhealthy or dizzy while doing the experiment, stop immediately, sit down and notify the instructor.
7. Students should report to the concerned labs as per time table schedule.
8. Students who turn up late to the labs will in no case be permitted to do the program scheduled for the day.
9. After completion of the program, certification of the concerned staff in-charge in the observation book is necessary.
10. Students should bring a notebook of about 100 pages and should enter the reading/observations into the notebook while performing the experiment.
11. When the experiment is completed, students should disconnect the setup made by them, and should return all the components/instruments taken for the purpose.
12. Any damage of the equipment or burn-out of components will be viewed seriously either by putting penalty or by dismissing the total group of students from the lab for the semester/year.
13. Students should be present in the labs for the total scheduled duration.
14. Students are required to prepare thoroughly to perform the experiment before coming to Laboratory.

LIST OF EXPERIMENTS

Sl.No	Experiments
1.	i. To interface LED/Buzzer with Arduino/Raspberry Pi and write a program to turn ON LED for 1 sec after every 2 seconds. ii. To interface Push button/Digital sensor (IR/LDR) with Arduino/Raspberry Pi and write a program to turn ON LED when push button is pressed or at sensor detection.
2.	i. To interface DHT11 sensor with Arduino/Raspberry Pi and write a program to print temperature and humidity readings. ii. To interface OLED with Arduino/Raspberry Pi and write a program to print temperature and humidity readings on it.
3.	To interface motor using relay with Arduino/Raspberry Pi and write a program to turn ON motor when push button is pressed.
4.	To interface Bluetooth with Arduino/Raspberry Pi and write a program to turn LED ON/OFF when '1'/'0' is received from smartphone using Bluetooth.
5.	To interface Bluetooth with Arduino/Raspberry Pi and write a program to send sensor data to smartphone using Bluetooth.
6.	Write a program on Arduino/Raspberry Pi to upload temperature and humidity data to thingspeak cloud.
7.	Write a program on Arduino/Raspberry Pi to retrieve temperature and humidity data from thingspeak cloud.
8.	To install MySQL database on Raspberry Pi and perform basic SQL queries

Vision of the Institute

“To create a community of knowledgeable and competent engineers to embody global standards of excellence and drive innovation and progress in industries, businesses, and research organizations around the world.”

Mission of the Institute

“To facilitate an inclusive and supportive learning environment that fosters collaboration, creativity, and the pursuit of excellence in engineering.”

Experiment - 1

Functional Testing of Devices

Flashing the OS on to the device into a stable functional state by porting desktop environment with necessary packages.

Raspberry Pi

You are going to take a first look at Raspberry Pi! You should have a Raspberry Pi computer in front of you for this. The computer shouldn't be connected to anything yet.

- Look at your Raspberry Pi. Can you find all the things labelled on the diagram?

- USB ports — these are used to connect a mouse and keyboard. You can also connect other components, such as a USB drive.
- SD card slot — you can slot the SD card in here. This is where the operating system software and your files are stored.
- Ethernet port — this is used to connect Raspberry Pi to a network with a cable. Raspberry Pi can also connect to a network via wireless LAN.
- Audio jack — you can connect headphones or speakers here.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- HDMI port — this is where you connect the monitor (or projector) that you are using to display the output from the Raspberry Pi. If your monitor has speakers, you can also use them to hear sound.
- Micro USB power connector — this is where you connect a power supply. You should always do this last, after you have connected all your other components.
- GPIO ports — these allow you to connect electronic components such as LEDs and buttons to Raspberry Pi.

Set up your SD card

If you have an SD card that doesn't have the Raspberry Pi OS operating system on it yet, or if you want to reset your Raspberry Pi, you can easily install Raspberry Pi OS yourself. To do so, you need a computer that has an SD card port — most laptop and desktop computers have one.

The Raspberry Pi OS operating system via the Raspberry Pi Imager

Using the Raspberry Pi Imager is the easiest way to install Raspberry Pi OS on your SD card.

Note: More advanced users looking to install a particular operating system should use this guide to [installing operating system images](#).

Download and launch the Raspberry Pi Imager

- Visit the [Raspberry Pi downloads page](#)

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- o Click on the link for the Raspberry Pi Imager that matches your operating system

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- When the download finishes, click it to launch the installer

Using the Raspberry Pi Imager

Anything that's stored on the SD card will be overwritten during formatting. If your SD card currently has any files on it, e.g. from an older version of Raspberry Pi OS, you may wish to back up these files first to prevent you from permanently losing them.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

When you launch the installer, your operating system may try to block you from running it. For example, on Windows I receive the following message:

- If this pops up, click on **More info** and then **Run anyway**
- Follow the instructions to install and run the Raspberry Pi Imager
- Insert your SD card into the computer or laptop SD card slot
- In the Raspberry Pi Imager, select the OS that you want to install and the SD card you would like to install it on

Note: You will need to be connected to the internet the first time for the the Raspberry Pi Imager to download the OS that you choose. That OS will then be stored for future offline use. Being online for later uses means that the Raspberry Pi imager will always give you the latest version.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)

#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Note: Many microSD cards come inside a larger adapter — you can slide the smaller card out using the lip at the bottom.

- Find the USB connector end of your mouse's cable, and connect the mouse to a USB port on your Raspberry Pi (it doesn't matter which port you use).

- Connect the keyboard in the same way.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- Make sure your screen is plugged into a wall socket and switched on.
- Look at the HDMI port(s) on your Raspberry Pi — notice that they have a flat side on top.

- Use a cable to connect the screen to the Raspberry Pi's HDMI port — use an adapter if necessary.

Raspberry Pi 4

Connect your screen to the first of Raspberry Pi 4's HDMI ports, labelled HDMI0.

You could connect an optional second screen in the same way.

Raspberry Pi 1, 2, 3

Connect your screen to the single HDMI port.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Note: nothing will display on the screen, because the Raspberry Pi is not running yet.

- If you want to connect the Pi to the internet via Ethernet, use an Ethernet cable to connect the Ethernet port on the Raspberry Pi to an Ethernet socket on the wall or on your internet router. You don't need to do this if you want to use wireless connectivity, or if you don't want to connect to the internet.

- If your screen has speakers, your Raspberry Pi can play sound through these. Or you could connect headphones or speakers to the audio port.

Start up your Raspberry Pi

Your Raspberry Pi doesn't have a power switch. As soon as you connect it to a power outlet, it will turn on.

- Plug the power supply into a socket and connect it to your Raspberry Pi's power port.

You should see a red LED light up on the Raspberry Pi, which indicates that Raspberry Pi is connected to power. As it starts up (this is also called booting), you will see raspberries appear in the top left-hand corner of your screen.

After a few seconds the Raspberry Pi OS desktop will appear.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Finish the setup

When you start your Raspberry Pi for the first time, the Welcome to Raspberry Pi application will pop up and guide you through the initial setup.

- Click Next to start the setup.
- Set your Country, Language, and Timezone, then click Next again.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Welcome to Raspberry Pi

Set Country

Enter the details of your location. This is used to set the language, time zone, keyboard and other international settings.

Country: United Kingdom

Language: British English

Timezone: London

☐ Use English language ☐ Use US keyboard

Press 'Next' when you have made your selection.

Back Next

- Enter a new password for your Raspberry Pi and click Next.

Welcome to Raspberry Pi

Change Password

The default 'pi' user account currently has the password 'raspberrypi'. It is strongly recommended that you change this to a different password that only you know.

Enter new password:

Confirm new password:

☒ Hide characters

Press 'Next' to activate your new password.

Back Next

- Connect to your WiFi network by selecting its name, entering the password, and clicking Next.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Note: if your Raspberry Pi model doesn't have wireless connectivity, you won't see this screen.

- Click Next let the wizard check for updates to Raspbian and install them (this might take a little while).

- Click Done or Reboot to finish the setup.

Note: you will only need to reboot if that's necessary to complete an update.

A tour of Raspberry Pi

Now it's time to take a tour of your Raspberry Pi.

- Do you see the raspberry symbol in the top left-hand corner? That's where you access the menu: click on it to find lots of applications.
- Click on Accessories, and then click on Text Editor.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- Type I just built a Raspberry Pi computer in the window that appears.

- Click on File, then choose Save, and then click on Desktop and save the file as

- You should see an icon named rp.txt appear on the desktop.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Your file has been saved to your Raspberry Pi's SD card.

- Close the text editor by clicking the X in the top right-hand corner of the window.
- Return to the menu, click on Shutdown, and then click on Reboot.
- When Raspberry Pi has rebooted, your text file should still be there on the desktop.
- Raspberry Pi runs a version of an operating system called Linux (Windows and macOS are other operating systems). This operating system allows you to make things happen by typing in commands instead of clicking on menu options. To try this out, click on the Terminal symbol at the top of the screen:

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- o In the window that appears, type:

```
ls
```

and then press Enter on the keyboard.

You can now see a list of the files and folders in your directory.

- o Now type this command to change directory to the Desktop:

```
cd Desktop
```

You have to press the Enter key after every command. Then

type:

```
ls
```

Can you see the text file you created?

- o Close the terminal window by clicking on the X.
- o Now drag to the Wastebasket on the desktop so the Raspberry Pi will be tidy for the next person using it.

Browsing the web

You might want to connect your Raspberry Pi to the internet. If you didn't plug in an ethernet cable or connect to a WiFi network during the setup, then you can connect now.

- o Click the icon with red crosses in the top right-hand corner of the screen, and select your network from the drop-down menu. You may need to ask an adult which network you should

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

choose.

- Type in the password for your wireless network, or ask an adult to type it for you, then click OK.

- When your Pi is connected to the internet, you will see a wireless LAN symbol instead of the red crosses.

- Click the web browser icon and search for .

Configuring your Raspberry Pi

You can control most of your Raspberry Pi's settings, such as the password, through the Raspberry Pi Configuration application found in Preferences on the menu.

- **System**

In this tab you can change basic system settings of your Raspberry Pi.

- Password — set the password of the **pi** user (it is a good idea to change the password from the factory default „raspberry“)
- Boot — select to show the Desktop or CLI (command line interface) when your

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Raspberry Pi starts

- Auto Login — enabling this option will make the Raspberry Pi automatically log in

whenever it starts

- Network at Boot — selecting this option will cause your Raspberry Pi to wait until a network connection is available before starting
- Splash Screen — choose whether or not to show the splash (startup) screen when your Raspberry Pi boots

- **Interfaces**

You can link devices and components to your Raspberry Pi using a lot of different types of connections. The Interfaces tab is where you turn these different connections on or off, so that your Raspberry Pi recognises that you've linked something to it via a particular type of connection.

- Camera — enable the [Raspberry Pi Camera Module](#)
- SSH — allow remote access to your Raspberry Pi from another computer using SSH
- VNC — allow remote access to the Raspberry Pi Desktop from another computer using VNC
- SPI — enable the SPI GPIO pins
- I2C — enable the I2C GPIO pins
- Serial — enable the Serial (Rx, Tx) GPIO pins
- 1-Wire — enable the 1-Wire GPIO pin
- Remote GPIO — allow access to your Raspberry Pi's GPIO pins from another

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

computer

- **Performance**

If you need to do so for a particular project you want to work on, you can change the performance settings of your Raspberry Pi in this tab.

Warning: Changing your Raspberry Pi's performance settings may result in it behaving erratically or not working.

- **Overclock** — change the CPU speed and voltage to increase performance

- **GPU Memory** — change the allocation of memory given to the GPU

- **Localisation**

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

This tab allows you to change your Raspberry Pi settings to be specific to a country or location.

- Locale — set the language, country, and character set used by your Raspberry Pi
- Timezone — set the time zone
- Keyboard — change your keyboard layout
- WiFi Country — set the WiFi country code

SKIT

Experiment - 2

Exporting Display On To Other Systems

Making use of available laptop/desktop displays as a display for the device using SSH client & X11 display server.

How Does it Work?

To connect a Raspberry Pi to a laptop display, you can simply use an Ethernet cable. The Raspberry Pi's desktop GUI (Graphical User Interface) can be viewed through the laptop display using a 100 Mbps Ethernet connection between the two. There are many software programs available that can establish a connection between a Raspberry Pi and your laptop. We used VNC server software to connect the Pi to our laptop. Installing the VNC server on your Pi allows you to see the Raspberry Pi's desktop remotely, using the mouse and keyboard as if you were sitting right in front of your Pi. It also means that you can put your Pi anywhere else in your home and still control it. Also, the internet can be shared from your laptop's WiFi over Ethernet. This also lets you access the internet on the Pi and connect it to your laptop display.

Setting up your Raspberry Pi

Before moving to connect your Raspberry Pi to your laptop display, you need an SD card with the OS preinstalled, or install **Raspbian** on a blank SD card. You will find lots of blogs and tutorials on preparing an SD card for the Raspberry Pi. If you are a beginner, you can simply click [here](#) and know more about this. This will show how to install the OS for the Raspberry Pi. You can also buy SD cards with the **Raspbian** and **NOOBs** operating systems preinstalled. *I would suggest you install the latest **full Raspbian OS image** from the official Raspberry Pi website as it is having VNC Server in the OS package.*

After setting up your SD Card, insert it into the Raspberry Pi. Next, connect your power adapter to the Raspberry Pi to power it. Also, connect your Raspberry Pi to the laptop via an Ethernet cable and connect a keyboard and mouse to it.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Note: You need screen and a mouse after booting a new OS into Pi for the first time as by

default, the SSH and VNC are disabled in Pi. Without SSH disabled, we cannot enable the PuTTY Configuration.

Sharing Internet Over Ethernet

This step explains how you can share your laptop internet with the Raspberry Pi via Ethernet cable. In Windows: To share the internet with multiple users over Ethernet, go to **Network and Sharing Center**. Then click on the WiFi network:

Click on Properties (shown below), then go to **Sharing** and click on “**Allow other network users to connect**”. Make sure that the networking connection is changed to the connection of the Raspberry Pi. In my case, it is **Ethernet**:

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Finding IP for PuTTY Configuration

By default, the laptop will give a *dynamic IP* to the Raspberry Pi. Thus, we have to find out the IP address of Pi now.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

As shown above, the IP assigned to my Pi is **192.168.137.144**. To check the IP assigned to

the connected Ethernet device, do the following. Considering that the IP assigned to your Pi is **192.168.137.144** and the subnet mask is **255.255.255.0** :

- Open the command prompt.
- Ping at **raspberrypi.mshome.net**.
- Stop the ping after 5 seconds.

Here, it is **192.168.137.154**. Note this somewhere.

PuTTY Configuration and VNC on Raspberry Pi

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- In the **Host Name**, enter the **IP Address** we noted from the command line.
- Ensure that the **Connection Type** is **SSH**.
- Hit **Enter** or click on **Open** to proceed.
- Now, a **new window** will open. It looks like a normal terminal window of the computer but it is *Raspberry Pi's terminalwindow* accessible on your laptop.
- It is display- login as:
- Enter **pi** as the username.
- Enter the **password** you set for the Raspberry Pi. The **default password** is **raspberry**
- If the password is correct, the Pi will load and you will access the terminal window of the Pi.
- Now, you need to start the VNC Server. Enter after the \$ sign - **sudo vncserver :1**
- This is to initialize the VNC Server on the Raspberry Pi.

VNC Server and VNC Viewer on Laptop

Now, Raspberry is ready to connect using VNC. We just need to install the VNC server on the laptop.

- Download **VNC Client** and install it. Now, download the **VNC Viewer** and install it on the laptop.
- Open the VNC Server and the VNC Viewer now.
- In the VNC Viewer, click on **File > New Connection**.
- Enter **IP Address** and in **Options > Picture Quality**, select **High**.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- Click OK. Now, double click on the IP Address.
- Enter **pi** in Username and your Pi's password (default is **raspberry**).
- Click on **Remember Password** so that you don't have to enter this next time.
- Click on **OK**.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

As you hit enter and all the things are correct, the Raspberry Pi Desktop will load in a new window. You can go into a full-screen mode by clicking on the options available above on the window.

Experiment - 3

GPIO Programming

Programming of available GPIO pins of the corresponding device using native programming language. Interfacing of I/O devices like LED/Switch etc., and testing the functionality.

GPIO Pins :

As shown in above figure, there are 40 output pins for the PI. But when you look at the second figure, you can see not all 40 pin out can be programmed to our use. These are only 26 GPIO pins which can be programmed. These pins go from **GPIO2 to GPIO27**.

These **26 GPIO pins can be programmed** as per need. Some of these pins also perform some special functions, we will discuss about that later. With special GPIO put aside, we have 17

GPIO remaining (light green Cn).

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Each of these 17 GPIO pins can deliver a maximum of **15mA current**. And the sum of

currents from all GPIO cannot exceed 50mA. So we can draw a maximum of 3mA in average from each of these GPIO pins. So one should not tamper with these things unless you know what you are doing.

Jessie

Here we are using **Raspberry Pi 2 Model B with Raspbian**

Hardware and Software requirements are previously discussed, you can look it up in the Raspberry Pi Introduction, other than that we need:

- Connecting pins
- 220Ω or 1KΩ resistor

- LED
 - Bread Board
- (Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Circuit Diagram:

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Steps:

1. On the desktop, go the Start Menu and choose for the **PYTHON 3**, as shown in figure below.

2. After that, PYHON will run and you will see a window as shown in below figure.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

3. After that, click on *New File* in *File* Menu, You will see a new Window open,

4. Save this file as *blinky* on the desktop,

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

5. After that write the program for *blinky* as given below and execute the program by clicking on “RUN” on „DEBUG“ option.

If the program has no errors in it, you will see a “>>>”, which means the program is executed successfully. By this time you should see the LED blinking three times. If there were any errors in the program, the execution tells to correct it. Once the error is corrected execute the program again.

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Program:

```
from gpiozero import LED from  
time import sleep
```

```
led = LED(17)
```

```
while True:
```

```
    led.on()
```

```
    sleep(1)
```

```
    led.off()
```

```
    sleep(1)
```

Experiment – 4

Interfacing Chronos eZ430

Chronos device is a programmable texas instruments watch which can be used for multiple purposes like PPT control, Mouse operations etc., Exploit the features of the device by interfacing with devices.

Using the eZ430 Chronos with a Raspberry Pi

The **eZ430 Chronos** development kit from Texas Instruments represents great value for money and provides a wristwatch with a wireless-enabled microcontroller, accelerometers and temperature and barometric pressure sensors, and a USB programmer and RF access point. In this post I take a look at what it takes to get it up and running with a Raspberry Pi.

The Chronos RF access point simply presents itself as a serial port to the operating system and drivers are included in Linux, and so any heavy lifting in enabling communications between the watch and host has already been done for us.

With the access point plugged into the Raspberry Pi USB we just need to install a few

dependencies in order to run the AI supplied demonstration software in a simple example

SRI KRISHNA INSTITUTE OF TECHNOLOGY
(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Python script. Assuming that you are running Debian Linux this can be achieved using the command:

```
$ sudo apt-get install python-serial tcl8.5 tk8.5 xdotool
```

Chronos Control Center

Chronos Control Center is a GUI tool that provides a selection of applications which demonstrate the capabilities of the eZ430 Chronos. The Linux version of the software must have been developed with x86 architecture in mind as it's provided as a binary installer rather than a tar archive. However, since it's Tcl/Tk based it should run on just about any platform/architecture for which this software is available. It's trivial to repackaging it so that it's not architecture-specific, and this just requires access to an Intel/AMD Linux machine on which to run the following commands:

```
$ unzip slac388a.zip
```

```
$ ./Chronos-Setup
```

```
$ tar zcyf ccc.tgz ~/Texas Instruments/eZ430-Chronos
```

Obviously if you installed the software to a location other than the default as part of the second step, you will need to use that location for the second argument in the third step. The ccc.tgz archive can then be copied to the Raspberry Pi and unpacked to a suitable location.

Control Center software running, with the access point enabled and the watch set to *ACC* mode and with RF enabled. Real-time data from the watch accelerometers is displayed, and by selecting *Mouse On* it's also possible to use the watch to control the Raspberry Pi mouse pointer through gesture. As can be seen the Control Center provides a number of other simple applications that can be selected via the tabs at the top.

Setting the time via a Python script

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

It should be possible to write host-based applications for the Chronos in just about any language that provides access to serial devices. When using the Python language this is

achieved via the **pySerial** library, and with a **reasonably short script** it's possible to configure the serial port, send the commands required to start up the RF access point, and then get the Raspberry Pi system time, format this into packets, transmit them to the watch and set the time accordingly.

Note that if you do wish to make use of the linked script you will need to change the line that configures the serial port parameters to read:

```
ser = serial.Serial('/dev/ttyACM0',115200,timeout=1)
```

Conclusion

Together the Chronos eZ430 and Raspberry Pi opens up all sorts of exciting possibilities, where data can be sourced from the watch sensors or the Internet, processed and pushed in either direction. With the relatively powerful processing capabilities of the Raspberry Pi being made use of, and its hardware capabilities further extended via the GPIO port. As such it would seem like a winning combination for low cost experimentation with wearable and ubiquitous computing. And with a little enhanced support from within the Python language, it is easy to see how the Chronos could become an incredibly fun accessory to Raspberry Pi- based learning in schools.

Experiment - 5

ON/OFF Control Based On Light Intensity

Using the light sensors, monitor the surrounding light intensity & automatically turn ON/OFF the high intensity LED's by taking some pre-defined threshold light intensity value.

Measure the intensity of light in a room using a single photocell and a capacitor connected to the raspberry pi with a bit of code in python.

What is Photocell?

The Photocell is a light sensor in which the resistance varies according to the intensity of light. The resistance reduces when it is in brighter surroundings. We have to set up a threshold value for the measurements of the intensity because it cannot give the precise measurements. If the measurements are below the threshold then it is dark, else it is bright.

Role of a Capacitor

A Capacitor is an electrical component that can store electrical energy temporarily. It is measured in Farads which is characterized by capacitance. The capacitor consists of 2 conductors that can hold the electric charge and when it is fully charged the capacitor starts discharging. This kind of alternative behavior is used to generate AC.

When the switch is pressed the current starts flowing and the capacitor starts charging up. The capacitor stops charging when the voltage at its end reaches the voltage of the battery. Then as there is no potential difference in the upper half of the circuit, no current flows there. Things needed

- A Raspberry pi
- 1 x breadboard
- A Photocell
- A Resistor
- A Capacitor (1 microfarad)

Circuit:

We need to measure the resistance of the photoresistor. The Raspberry pi acts as the battery whereas the GPIO pin 1 provides 3.3 V to the photoresistor. Make the GPIO pin 12 as the bidirectional pin (input and output pin). **When the capacitor is charging it will take some time to reach a voltage that registers as high.** GPIO pin 6 is grounded which is connected to the negative side of the capacitor (short end). Check how long it takes for the input pin to become high and use the result to calculate the resistance of the photocell.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- Insert a photocell in a breadboard.
- Connect the GPIO pin 1 (3.3 V) to the resistor which is connected serial to the Photocell.
- Connect the other end of the photocell to the GPIO pin 12 and the Capacitor as shown in the diagram.
- GPIO pin 6 (ground) is connected to the other end of the capacitor (short end).

Code

```
#measuring the light intensity using a photocell
import RPi.GPIO as GPIO,time,os          #import the libraries
DEBUG=1
GPIO.setmode(GPIO.BOARD)
GPIO.setwarnings(False)
def RCtime(RCpin): # function start
    reading=0
    GPIO.setup(RCpin,GPIO.OUT)
    GPIO.output(RCpin,GPIO.LOW)
    time.sleep(2)          # time to discharge capacitor
    GPIO.setup(RCpin,GPIO.IN)
    while (GPIO.input(RCpin) == GPIO.LOW): #
        the loop will run till the capacitor is charged
        reading += 1
    # measuring time which in turn is measuring resistance
```

Experiment - 6

Battery Voltage Range Indicator

Monitor the voltage level of the battery and indicating the same using multiple LED's (for ex: for 3V battery and 3 led's, turn on 3 led's for 2-3V, 2 led's for 1-2V, 1 led for 0.1-1V & turn off all for 0V)

Battery Voltage Indicator using Arduino and LED Bar Graph

Batteries come with a certain voltage limit and if the voltage goes beyond the prescribed limits while charging or discharging, the life of the battery get affected or reduced. Whenever we use a battery powered project, sometimes we need to check the battery voltage level, whether it is needed to be charged or replaced. This circuit will help you to monitor the voltage of your battery. This **Arduino battery voltage indicator** indicates the status of the battery by glowing LEDs on a **10 Segment LED Bar Graph** according to the battery voltage. It also shows your battery voltage on the LCD connected to the Arduino.

Material Required

- Arduino UNO
- 10 Segment LED Bar Graph
- LCD (16*2)
- Potentiometer-10k
- Resistor (100ohm-10;330ohm)
- Battery (to be tested)
- Connecting wires
- 12v adapter for Arduino

LED Bar Graph

The LED bar graph comes in industrial standard size with a low power consumption. The bar is categorized for luminous intensity. The product itself remains within RoHS compliant version. It has a forward voltage of up to 2.6v. The power dissipation per segment is 65mW. The operating temperature of the LED bar graph is -40°C to 80°C. There are many application for the LED bar graph like Audio equipment, Instrument panels, and Digital readout display.

Pin Configuration

Pin	Function	Pin	Function
1	Anode a	11	Cathode j
2	Anode b	12	Cathode i
3	Anode c	13	Cathode h
4	Anode d	14	Cathode g
5	Anode e	15	Cathode f
6	Anode f	16	Cathode e
7	Anode g	17	Cathode d
8	Anode h	18	Cathode c
9	Anode i	19	Cathode b
10	Anode j	20	Cathode a

Working of Battery Voltage Indicator

Battery Voltage Indicator just read the value from Arduino Analog pin and convert it into a digital value by using the Analog to Digital Conversion (ADC) formula. The **Arduino Uno ADC** is of 10-bit resolution (so the integer values from $0 - 2^{10} = 1024$ values). This means that it will map input voltages between 0 and 5 volts into integer values between 0 and 1023. So if we multiply input *analogValue* to $(5/1024)$, then we get the digital value of input voltage. Learn here how to use ADC input in Arduino. Then the digital value is used to glow the LED bar Graph accordingly.

CODE:

```
#include <LiquidCrystal.h>
```

```
const int rs = 12, en = 13, d0 = A0, d1 = A1, d2 = A2, d3 = A3;
```

```
LiquidCrystal lcd(rs, en, d0, d1, d2, d3);
```

```

Displaying RSS News Feed On Display Interface

Displaying the RSS news feed headlines on a LCD display connected to device. This can be adapted to other websites like twitter or other information websites. Python can be used to acquire data from the internet.

Keeping up to date with the latest news is tough and sometimes we need a little help. RSS feeds provide a great way to quickly digest lots of news quickly. Sure you could visit an RSS feed or have an RSS reader on your computer, but what if you could have a simple, dedicated device that only shows the headlines?

Here's a [Raspberry Pi](#) project that will use Python code to read an RSS feed, the Tom's Hardware feed for example, and display the top five headlines on an LCD screen.

To build this project you will need:

- Any model of Raspberry Pi with Raspberry Pi OS and GPIO Pins
- An I2C LCD screen such as [this one](#)
- 4 x Female to female jumper wires

1. **Install Python libraries** to use LCD screens and work with RSS feeds by entering the following commands:

```
sudo pip3 install rpi-lcd feedparser
```

2. **Enable the I2C interface** via Preferences >> Raspberry Pi Configuration

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

3. Connect the I2C LCD screen as per the diagram.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

4. **Launch Thonny.** You can find it on the start menu under Programming.
5. **In a new file import libraries of Python code** to use the LCD screen, control the pace of

the project, read the RSS feed and finally manipulate text into chunks.

```
from rpi_lcd import LCD
from time import sleep
import feedparser
import textwrap
```

6. **Create an object, called “tom”** which will store the RSS feed data from Tom’s Hardware.

```
tom = feedparser.parse("https:// HYPERLINK
"http://www.tomshardware.com/uk/feeds/all" \h
www.tomshardware.com/uk/feeds/all")
```

7. **Create a connection to the LCD** and then pause the code for 1 second.

```
lcd = LCD()
sleep(1)
```

8. **Use a for loop** to repeat code five times. If you want more than 5 headlines, change the (5) to a higher number.

```
for i in range(5):
```

9. **Print the entries from the Tom’s Hardware RSS feed.** The value of i is incremented each time the for loop goes round, to a maximum of five.

```
print(tom['entries'][i]['title'])
```

10. **Create an object called split** and use that to save 16 character chunks of the RSS feed. The chunk size is set by the 16 character screen size of the LCD.

```
split = textwrap.wrap(text, 16)
```

11. **Create an object called split** and use that to save 16 character chunks of the RSS feed. The chunk size is set by the 16 character screen size of the LCD.

```
split = textwrap.wrap(text, 16)
```

12. **Print “Tom’s Hardware”** (or the name of your news source) **to the first line of the LCD screen.**

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

lcd.text("Tom's Hardware", 1)

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

13. Create another **for loop** to print the contents of the split object to the LCD screen.

```
for i in range(len(split)):
```

SKIT

```
lcd.text(split[i], 2)
sleep(0.5)
```

14. Add a one second pause before clearing the LCD screen.

```
sleep(1)
lcd.clear()
```

15. Save the code as TomsRSSFeed.py

Code:

```
from rpi_lcd import LCD from
time import sleep import
feedparser
import textwrap
tom = feedparser.parse("https://www.tomshardware.com/uk/feeds/all")

lcd = LCD() sleep(5)
for i in range(5):
    print(tom['entries'][i]['title'])
    text = tom['entries'][i]['title'] split =
    textwrap.wrap(text, 16)
    lcd.text("Tom's Hardware", 1) for i
    in range(len(split)):
        lcd.text(split[i], 2)
        sleep(0.5) sleep(1)

lcd.clear()
```

Experiment - 9

Porting Openwrt

To the Device Attempt to use the device while connecting to a wifi network using a USB dongle and at the same time providing a wireless access point to the dongle.

Setting up a Raspberry Pi as a routed wireless access point

A Raspberry Pi within an Ethernet network can be used as a wireless access point, creating a secondary network. The resulting new wireless network is entirely managed by the Raspberry Pi.

If you wish to extend an existing Ethernet network to wireless clients, consider instead setting up a [bridged access point](#).

A routed wireless access point can be created using the inbuilt wireless features of the Raspberry Pi 4, Raspberry Pi 3 or Raspberry Pi Zero W, or by using a suitable USB wireless dongle that supports access point mode. It is possible that some USB dongles may need slight changes to their settings. If you are having trouble with a USB wireless dongle, please check the [forums](#). This documentation was tested on a Raspberry Pi 3B running a fresh installation of Raspberry Pi

OS Buster.

Before we start

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

- Ensure you have administrative access to your Raspberry Pi. The network setup will be modified as part of the installation: local access, with screen and keyboard connected to your Raspberry Pi, is recommended.
- Connect your Raspberry Pi to the Ethernet network and boot the Raspberry Pi OS.
- Ensure the Raspberry Pi OS on your Raspberry Pi is up-to-date and reboot if packages were installed in the process.
- Take note of the IP configuration of the Ethernet network the Raspberry Pi is connected to:

- In this document, we assume IP network `10.10.0.0/24` is configured on the Ethernet LAN, and the Raspberry Pi is going to manage IP network `192.168.4.0/24` for wireless clients.
- Please select another IP network for wireless, e.g. `192.168.10.0/24`, if IP network `192.168.4.0/24` is already in use by your Ethernet LAN.

- Have a wireless client (laptop, smartphone, ...) ready to test your new access point.

Install the access point and network management software

In order to work as an access point, the Raspberry Pi needs to have the `hostapd` access point software package installed:

```
sudo apt install hostapd
```

Enable the wireless access point service and set it to start when your Raspberry Pi boots:

```
sudo systemctl unmask hostapd  
sudo systemctl enable hostapd
```

In order to provide network management services (DNS, DHCP) to wireless clients, the Raspberry Pi needs to have the `dnsmasq` software package installed:

```
sudo apt install dnsmasq
```

Finally, install `netfilter-persistent` and its plugin `iptables-persistent`. This utility helps by

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

saving firewall rules and restoring them when the Raspberry Pi boots:

```
sudo DEBIAN_FRONTEND=noninteractive apt install -y netfilter-persistent iptables-  
persistent
```

Software installation is complete.

Set up the network router

The Raspberry Pi will run and manage a standalone wireless network. It will also route between the wireless and Ethernet networks, providing internet access to wireless clients. If you prefer, you can choose to skip the routing by skipping the section "Enable routing and IP masquerading" below, and run the wireless network in complete isolation.

Define the wireless interface IP configuration

The Raspberry Pi runs a DHCP server for the wireless network; this requires static IP configuration for the wireless interface (`wlan0`) in the Raspberry Pi. The Raspberry Pi also acts as the router on the wireless network, and as is customary, we will give it the first IP address in the network: `192.168.4.1` .

To configure the static IP address, edit the configuration file for `dhcpcd` with:

```
sudo nano /etc/dhcpcd.conf
```

Go to the end of the file and add the following:

```
interface wlan0  
static ip_address=192.168.4.1/24  
    nohook wpa_supplicant
```

Enable routing and IP masquerading

This section configures the Raspberry Pi to let wireless clients access computers on the main (Ethernet) network, and from there the internet. **NOTE:** If you wish to block wireless clients from accessing the Ethernet network and the internet, skip this section.

To enable routing, i.e. to allow traffic to flow from one network to the other in the Raspberry Pi,

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

```
sudo nano /etc/sysctl.d/routed-ap.conf
```

create a file using the following command, with the contents below:

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

File contents:

```
# https://HYPERLINK
"http://www.raspberrypi.org/documentation/configuration/wireless/access-point-routed.md"
'h /www.ra HYPERLINK
"http://www.raspberrypi.org/documentation/configuration/wireless/access-point-routed.md"
'h spberrypi.org/documentation/configuration/wireless/access-point-routed.md # Enable
IPv4 routing
net.ipv4.ip_forward=1
```

Enabling routing will allow hosts from network `192.168.4.0/24` to reach the LAN and the main router towards the internet. In order to allow traffic between clients on this foreign wireless network and the internet without changing the configuration of the main router, the Raspberry Pi can substitute the IP address of wireless clients with its own IP address on the LAN using a "masquerade" firewall rule.

- The main router will see all outgoing traffic from wireless clients as coming from the Raspberry Pi, allowing communication with the internet.
- The Raspberry Pi will receive all incoming traffic, substitute the IP addresses back, and forward traffic to the original wireless client.

This process is configured by adding a single firewall rule in the Raspberry Pi:

```
sudo iptables -t nat -A POSTROUTING -o eth0 -j MASQUERADE
```

Now save the current firewall rules for IPv4 (including the rule above) and IPv6 to be loaded at boot by the `netfilter-persistent` service:

```
sudo netfilter-persistent save
```

Filtering rules are saved to the directory `/etc/iptables/`. If in the future you change the configuration of your firewall, make sure to save the configuration before rebooting. Configure the DHCP and DNS services for the wireless network

The DHCP and DNS services are provided by `dnsmasq`. The default configuration file serves as a template for all possible configuration options, whereas we only need a few. It is easier to start from an empty file.

Rename the default configuration file and edit a new one:

```
sudo mv /etc/dnsmasq.conf /etc/dnsmasq.conf.orig
```

```
sudo nano /etc/dnsmasq.conf
```

Add the following to the file and save it:

```
interface=wlan0 # Listening interface
dhcp-range=192.168.4.2,192.168.4.20,255.255.255.0,24h
    # Pool of IP addresses served via
DHCP domain=wlan    # Local wireless DNS
domain address=/gw.wlan/192.168.4.1
    # Alias for this router
```

The Raspberry Pi will deliver IP addresses between `192.168.4.2` and `192.168.4.20`, with a lease time of 24 hours, to wireless DHCP clients. You should be able to reach the Raspberry Pi under the name `gw.wlan` from wireless clients.

There are many more options for `dnsmasq`; see the default configuration file (`/etc/dnsmasq.conf`) or the [online documentation](#) for details.

Ensure wireless operation

Countries around the world regulate the use of telecommunication radio frequency bands to ensure interference-free operation. The Linux OS helps users comply with these rules by allowing applications to be configured with a two-letter "WiFi country code", e.g. US for a computer used in the United States.

In the Raspberry Pi OS, 5 GHz wireless networking is disabled until a WiFi country code has been configured by the user, usually as part of the initial installation process (see wireless configuration pages in this [section](#) for details.)

To ensure WiFi radio is not blocked on your Raspberry Pi, execute the following command:

```
sudo rfkill unblock wlan
```

This setting will be automatically restored at boot time. We will define an appropriate country code in the access point software configuration, next.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Configure the access point software

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Create the `hostapd.conf` configuration file, located at `/etc/hostapd/hostapd.conf`, to add the various parameters for your new wireless network.

```
sudo nano /etc/hostapd/hostapd.conf
```

Add the information below to the configuration file. This configuration assumes we are using channel `7`, with a network name of `NameOfNetwork`, and a password `AardvarkBadgerHedgehog`. Note that the name and password should **not** have quotes around them. The passphrase should be between 8 and 64 characters in length.

```
country_code=GB
interface=wlan0
ssid=NameOfNetwork
hw_mode=g
channel=7
macaddr_acl=0
auth_algs=1
ignore_broadcast_ssid=0 wpa=2
wpa_passphrase=AardvarkBadgerHedgehog
wpa_key_mgmt=WPA-PSK
wpa_pairwise=TKIP
rsn_pairwise=CCMP
```

Note the line `country_code=GB`: it configures the computer to use the correct wireless frequencies in the United Kingdom. **Adapt this line** and specify the two-letter ISO code of your country. See [Wikipedia](https://en.wikipedia.org/wiki/ISO_3166-1) for a list of two-letter ISO 3166-1 country codes.

To use the 5 GHz band, you can change the operations mode from `hw_mode=g` to `hw_mode=a`. Possible values for `hw_mode` are:

- a = IEEE 802.11a (5 GHz) (Raspberry Pi 3B+ onwards)
- b = IEEE 802.11b (2.4 GHz)
- g = IEEE 802.11g (2.4 GHz)

e that when changing the `hw_mode`, you may need to also change the `channel` -
No

see [Wikipedia](#) for a list of allowed combinations.

Run your new wireless access point

Now restart your Raspberry Pi and verify that the wireless access point becomes automatically available.

```
sudo systemctl reboot
```

Once your Raspberry Pi has restarted, search for wireless networks with your wireless client. The network SSID you specified in file `/etc/hostapd/hostapd.conf` should now be present, and it should be accessible with the specified password.

If SSH is enabled on the Raspberry Pi, it should be possible to connect to it from your wireless client as follows, assuming the `pi` account is present:

HYPERLINK
"mailto:pi@gw.wlan"

If your wireless client has access to your Raspberry Pi (and the internet, if you set up routing), congratulations on setting up your new access point!

HYPERLINK
"mailto:sshpi@192.168.4.1" \h ssh
pi@192.168.4.1

Experiment - 10

Hosting a website on Board

Building and hosting a simple website(static/dynamic) on the device and make it accessible online. There is a need to install server(eg: Apache) and thereby host the website.

Setting up an Apache Web Server on a Raspberry Pi

Apache is a popular web server application you can install on the Raspberry Pi to allow it to serve web pages.

On its own, Apache can serve HTML files over HTTP, and with additional modules can serve dynamic web pages using scripting languages such as PHP.

Install Apache

First, update the available packages by typing the following command into the Terminal:

```
sudo apt update
```

Then, install the apache2 package with this command:

```
sudo apt install apache2 -y
```

Test the web server

By default, Apache puts a test HTML file in the web folder. This default web page is served

when you browse to  on the Pi itself, or  (whatever the

```
"http://192.168.1.10/"  
" \h  
http://192.168.1.10
```

Pi's IP address is) from another computer on the network. To find the Pi's IP address, type `ifconfig` at the `commandline` (or read more about finding your [IP address](#)).

Browse to the default web page either on the Pi or from another computer on the network and you should see the following:

The screenshot shows the Apache2 Debian Default Page. At the top, there is a red header with the Debian logo and the text "Apache2 Debian Default Page". Below this, a red banner says "It works!". The main text explains that this is the default welcome page used to test the correct operation of the Apache2 server after installation on Debian systems. It states that if you can read this page, it means that the Apache HTTP server installed at this site is working properly. It advises replacing this file (located at `/var/www/html/index.html`) before continuing to operate your HTTP server. It also mentions that if you are a normal user and don't know what this page is about, it probably means the site is currently unavailable due to maintenance. Below this, a blue banner says "Configuration Overview". The text explains that Debian's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Debian tools. It states that the configuration system is **fully documented** in `/usr/share/doc/apache2/README.Debian.gz`. It also mentions that documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server. It then states that the configuration layout for an Apache2 web server installation on Debian systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|   |-- ports.conf
|-- mods-enabled
|   |-- *.load
|   |-- *.conf
|-- conf-enabled
|   |-- *.conf
|-- sites-enabled
|   |-- *.conf
```

This means you have Apache working!

Changing the default web page

This default web page is just an HTML file on the filesystem. It is located `/var/www/html/index.html`

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

at

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E., New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Navigate to this directory in a terminal window and have a look at what's inside:

```
cd /var/www/html  
ls -al
```

This will show you:

```
total 12                                8 01:29 .  
drwxr-xr-x  2 root root 4096 Jan      8 01:28 ..  
drwxr-xr-x 12 root root 4096 Jan      8 01:29 index.html  
-rw-r--r--  1 root root 177 Jan
```

This shows that by default there is one file in `/var/www/html/` called `index.html` and it is owned by the `root` user (as is the enclosing folder). In order to edit the file, you need to change its ownership to your own username. Change the owner of the file (the default user is assumed here) using `sudo chown pi: index.html`.

You can now try editing this file and then refreshing the browser to see the web page change.
Your own website

If you know HTML you can put your own HTML files and other assets in this directory and serve them as a website on your local network.

Additional - install PHP

To allow your Apache server to process PHP files, you'll need to install the latest version of PHP and the PHP module for Apache. Type the following command to install these:

```
sudo apt install php libapache2-mod-php -y
```

Now remove the `index.html` file:

```
sudo rm index.html
```

and create the file `index.php` :

```
sudo nano index.php
```

Put some PHP content in it:

```
<?php echo "hello world"; ?>
```

Now save and refresh your browser. You should see "hello world". This is not dynamic but still served by PHP. Try something dynamic:

```
<?php echo date('Y-m-d H:i:s'); ?>
```

Experiment – 11

Webcam Server

Interfacing the regular usb webcam with the device and turn it into fully functional IP webcam & test the functionality.

Using a standard USB webcam

Rather than using the Raspberry Pi [camera module](#), you can use a standard USB webcam to take pictures and video on the Raspberry Pi.

Note that the quality and configurability of the camera module is highly superior to a standard USB webcam.

Install fswebcam

First, install the `fswebcam` package:

```
sudo apt install fswebcam
```

Add your user to video group

If you are not using the default pi user account, you need to add your username to the `video` group, otherwise you will see 'permission denied' errors.

```
sudo usermod -a -G video <username>
```

To check that the user has been added to the group correctly, use the `groups` command.

Basic usage

Enter the command `fswebcam` followed by a filename and a picture will be

taken using the webcam, and saved to the filename specified:

```
fswebcam image.jpg
```

This command will show the following information:

```
--- Opening /dev/video0...  
Trying source module v4l2...  
/dev/video0 opened.  
No input was specified, using the first.  
Adjusting resolution from 384x288 to 352x288.  
--- Capturing frame...  
Corrupt JPEG data: 2 extraneous bytes before marker 0xd4  
Captured frame in 0.00 seconds.  
--- Processing captured image...  
Writing JPEG image to 'image.jpg'.
```

Note the small default resolution used, and the presence of a banner showing the timestamp.

Specify resolution

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesarghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

The webcam used in this example has a resolution of

1280 x 720

so to specify the

resolution I want the image to be taken at, use the `-r` flag:

```
fswebcam -r 1280x720 image2.jpg
```

This command will show the following information:

```
--- Opening /dev/video0...
```

```
Trying source module v4l2...
```

```
/dev/video0 opened.
```

```
No input was specified, using the first.
```

```
--- Capturing frame...
```

```
Corrupt JPEG data: 1 extraneous bytes before marker 0xd5
```

```
Captured frame in 0.00 seconds.
```

```
--- Processing captured image...
```

```
Writing JPEG image to 'image2.jpg'.
```

Picture now taken at the full resolution of the webcam, with the banner present.

Specify no banner

Now add the `--no-banner` flag:

```
fswebcam -r 1280x720 --no-banner image3.jpg
```

which shows the following information:

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

```
--- Opening /dev/video0... Trying  
source module v4l2...  
/dev/video0 opened.  
No input was specified, using the first.  
--- Capturing frame...  
Corrupt JPEG data: 2 extraneous bytes before marker 0xd6  
Captured frame in 0.00 seconds.  
--- Processing captured image...  
Disabling banner.  
Writing JPEG image to 'image3.jpg'.
```

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Now the picture is taken at full resolution with no banner.

Bad Pictures

You may experience poor quality pictures with a USB webcam, such as this accidentally artistic piece:

Some webcams are more reliable than others, but this sort of issue may occur with poor quality webcams. If the problem persists, ensure your system is up to date. Also try other webcams, but you'll get the best performance from the Raspberry Pi camera

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T.U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

module.

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Bash script

You can write a Bash script which takes a picture with the webcam. The script below saves the images in the `/home/pi/webcam` directory, so create the `webcam` subdirectory first with:

```
mkdir webcam
```

To create a script, open up your editor of choice and write the following example code:

```
#!/bin/bash
DATE=$(date +"%Y-%m-%d_%H%M")
fswebcam -r 1280x720 --no-banner /home/pi/webcam/$DATE.jpg
```

This script will take a picture and name the file with a timestamp. Say we saved it as `webcam.sh`, we would first make the file executable:

```
chmod +x webcam.sh
```

Then run with:

```
./webcam.sh
```

Which would run the commands in the file and give the usual output:

--- Opening /dev/video0...

Trying source module v4l2...

/dev/video0 opened.

No input was specified, using the first.

--- Capturing frame...

Corrupt JPEG data: 2 extraneous bytes before marker 0xd6

Captured frame in 0.00 seconds.

--- Processing captured image...

SRI KRISHNA INSTITUTE OF TECHNOLOGY

(Accredited by NAAC, Approved by A.I.C.T.E. New Delhi, Recognised by Govt. of Karnataka & Affiliated to V.T U., Belagavi)
#29, Chimney Hills, Hesaraghatta Main Road, Chikkabanavara Post, Bengaluru- 560090

Disabling banner.

Writing JPEG image to '/home/pi/webcam/2013-06-07_2338.jpg'.

Time-lapse using cron

You can use `cron` to schedule taking a picture at a given interval, such as every

minute to capture a time-lapse.

First open the cron table for editing:

```
crontab -e
```

This will either ask which editor you would like to use, or open in your default editor. Once you have the file open in an editor, add the following line to schedule taking a picture every minute (referring to the Bash script from above):

```
* * * * * /home/pi/webcam.sh 2>&1
```

Save and exit and you should see the message:

```
crontab: installing new crontab
```

Ensure your script does not save each picture taken with the same filename. This will overwrite the picture each time.
