Abstract

This document specifies an Evidence property for individuals based on the OIDF OpenID Connect for Identity Assurance specification [2].

Status of This Document

This specification is intended to be published by the [Credentials Community Group](#). It is not a W3C Standard nor is it on the W3C Standards Track. Please note that under the [W3C Community Contributor License Agreement \(CLA\)](#) there is a limited opt-out and other conditions apply. Learn more about [W3C Community and Business Groups](#).

1. Introduction	2
2. Details	2

1. Introduction

In banking and other applications where the authentication of clients is required to a specific level of confidence, level of assurance or to comply with any other verification or validation requirements, then the Verifier may need to know various metadata about how the credentials were bound to the subject through verification and validation processes. The eKYC & Identity Assurance working group of the OpenID Foundation has a draft specification [2] that describes this property, and this specification describes how part of that can be used as a type of Evidence property for the W3C Verifiable Credentials Data Model [1].

2. Details

The VCDM Evidence property requires a globally unique type to be defined, which must be a URI. What properties follow the type are specific to this type.

Type

The type that is be used to refer to this definition MUST be ["https://openid.bitbucket.io/ekyc/openid-connect-4-identity-assurance.html#name-verification-element"](https://openid.bitbucket.io/ekyc/openid-connect-4-identity-assurance.html#name-verification-element)

An evidence property of this type MUST have a verification property, as defined in the OpenID Connect for Identity Assurance specification [2].

A non-normative example of this Evidence property follows:

```
...
{
