Presentation Blog

During this week we had to prepare for the presentation that would take place the following week in class. The teacher had uploaded a presentation example for us to view and so we had a guide on what to include when we went to make our own. One of the first things I did was start getting pictures of my environment assets that I made over the course of the group project onto my personal PowerPoint so I could have them ready in case I would be adding any to the group PowerPoint.

The next thing I did was go onto my projects in Maya and started making some of the Assets I made into turntables. In a previous blog I talked about the turntables along with cameras. I showed a couple of examples on that particular blog. I did this because instead of the still image this would give it more of a professional look to the asset and allow the viewer of the turntable to view the 360 of it and not just one still image from a certain side or focus.

On Monday of the week, I met up with my team to have a meeting so we could go over the PowerPoint in full and then record our voice overs for it that would be playing over the PowerPoint itself once it was shown in class. This helped especially because we could all discuss what the PowerPoint looked like currently and if anything could be added to it to help improve the overall look and if it was professional enough. It's easier to talk once everyone is in the same room as other than one day a week we had been communicating online. So meeting up in person we all then had a clear idea of what the actual presentation was and then how to go about presenting it.

I took some notes on what I needed to do or could try to achieve and then actually got an idea for another slide to add so I began to work on it and add the necessary pictures of my assets on the information too so it looked professional.

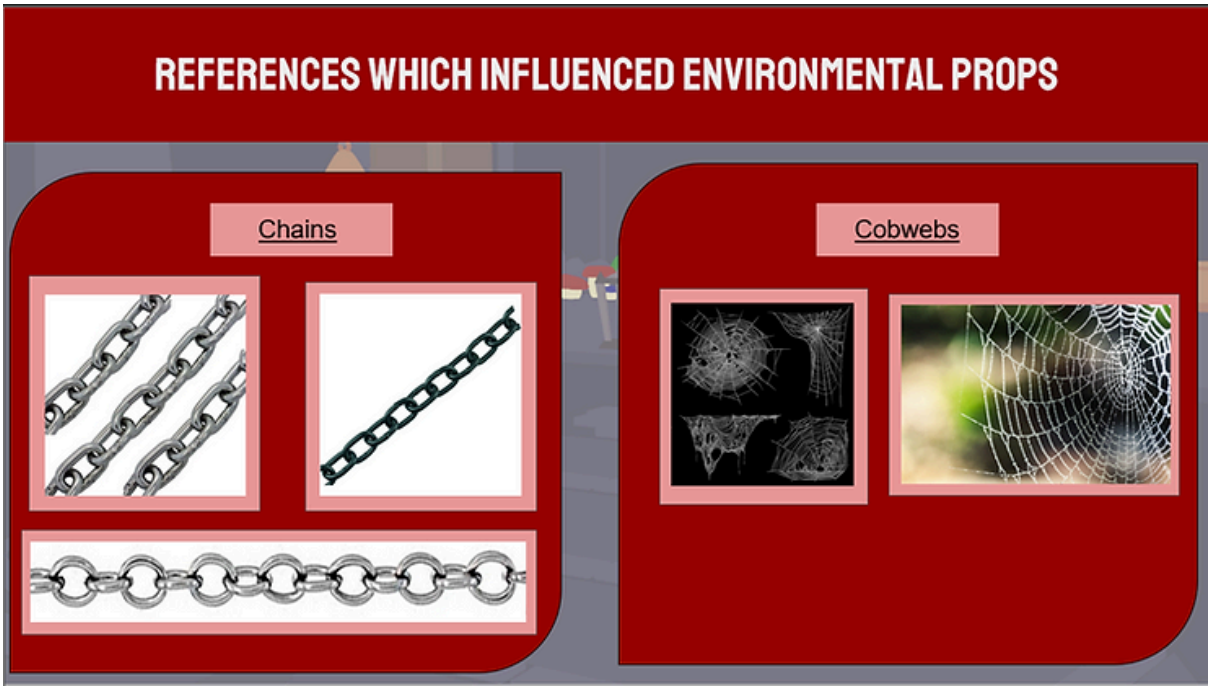

On Tuesday I recorded my voiceover for the 2 Presentation Slides I was doing so I could talk through them and explain how I completed them and the information I gathered from them. It took me a few times to get the recording right and once I did I sent it on Discord so my teammate Scott could edit the Presentation Video with the recordings over the slides.

The PowerPoint was finished in time so on Thursday we watched our PowerPoint Presentation video. After it was done we then received feedback. For my slides I got back that the actual books I made were not in the correct Roki style and needed to be redone without the UV Mapping on it. I was also told to make a variety of sizes for the books as currently they were all the same width. Also to make an opened book for the scene the Seer character made by teammate Mumo would be reading some books and be in the middle of one. It would help to do these. In the next blog I would be going into detail what I did with the feedback that I received after the presentation.

I was happy with how the Presentation went and was glad to get some feedback on a couple of assets. Now I would work on them to try and make them better before sending in the final assignment along with my team.
