

# CMG'25 Hackathon guidelines

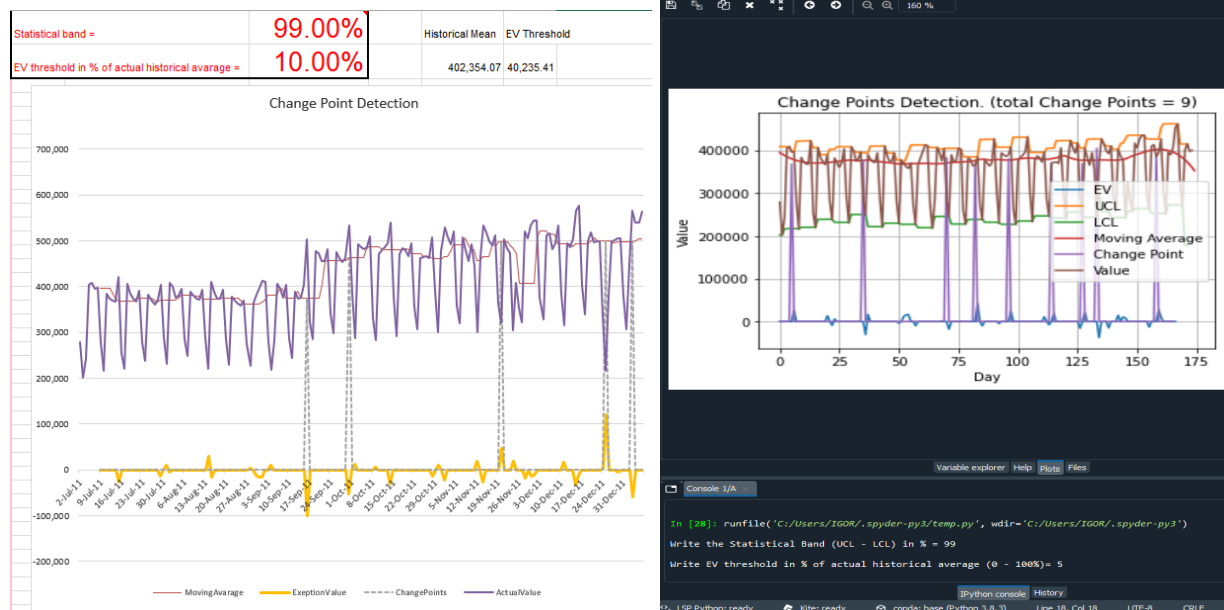

## ANNOUNCE (to publish before conference)

**The task is** to find some change points and/or anomalies in the given time stamped data to see different phases/patterns .

Participants can use any tools or libraries/packages (in R, Python and so on) to detect change points and/or anomalies in the data.

Or they can use the free Change Points detection API (e.g. via [Postman.com](https://postman.com)) described in [Change Point Detection is implemented in the free web tool Perfomalist](#) Particularly the instruction on how to use that is described [here](#).

To visualize the result any spreadsheet charting could be used or other means (e.g. python, R and so on). Examples are on the following picture:

The time to work on the task - 3 hours.

The result would be judged by CMG experts and the winner will get an award and time to make a short presentation.

Vendors of similar tools are welcome to participate.

If participants would like to use MATLAB for anomaly detection tools, we have a licensed version available here:

**URL for event page:** <https://www.mathworks.com/licensecenter/classroom/4866200/>

1. this will take you to a MathWorks account Sign-in page.
2. Create an account or use an existing account
3. Press "Access MATLAB Online" button followed by "Open MATLAB Online"

## On site activities

Data to test: <https://github.com/numenta/NAB/tree/master/data>

Particularly the following csv files:

Name	Owner	Last modified ▼	↓	File size
 Twitter_volume_IBM.csv 	 me	12:04 PM me		343 KB
 Twitter_volume_GOOG.csv 	 me	12:04 PM me		353 KB
 Twitter_volume_FB.csv 	 me	12:04 PM me		351 KB
 Twitter_volume_CVS.csv 	 me	12:03 PM me		341 KB
 Twitter_volume_KO.csv 	 me	12:01 PM me		347 KB
 Twitter_volume_PFE.csv 	 me	12:01 PM me		341 KB
 Twitter_volume_UPS.csv 	 me	12:01 PM me		342 KB
 Twitter_volume_CRM.csv 	 me	12:00 PM me		343 KB
 Twitter_volume_AMZN.csv 	 me	12:00 PM me		356 KB
 Twitter_volume_AAPL.csv 	 me	11:59 AM me		359 KB

LINK TO THE FOLDER WITH DATA IS [HERE](#)

## EXAMPLE 1

Simple case: [art\\_daily\\_flatmiddle.csv](#)

Tool is [performalist.com](http://performalist.com) Change Point detection API described [HERE](#)

1st step to change the format of the data (using EXCEL or Google sheet means):  
From original:

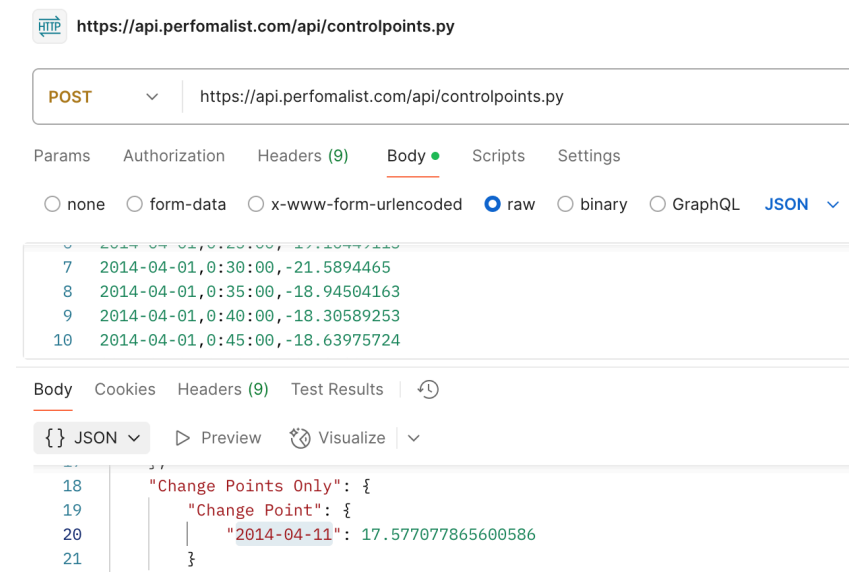

```
timestamp,value  
2014-04-01 00:00:00,-21.0483826823
```

2014-04-01 00:05:00,-20.2954768676  
2014-04-01 00:10:00,-18.127229468299998  
2014-04-01 00:15:00,-20.1716653997

TO performalist form:

date,time,value  
2014-04-01,0:00:00,-21.04838268  
2014-04-01,0:05:00,-20.29547687  
2014-04-01,0:10:00,-18.12722947  
2014-04-01,0:15:00,-20.1716654

Then call performalist API (e.g. using [postman.com](https://postman.com))

The result is one change point on 2014-04-11, which can be easily validated by building the spreadsheet chart (see below):

## value vs. timestamp

## EXAMPLE 2

More difficult case:

[https://github.com/numenta/NAB/blob/master/data/realTraffic/TravelTime\\_451.csv](https://github.com/numenta/NAB/blob/master/data/realTraffic/TravelTime_451.csv)

After repeating the above steps (see Example 1) the result should show several change points:

HTTP <https://api.perfomalist.com/api/controlpoints.py>

POST <https://api.perfomalist.com/api/controlpoints.py>

Params Authorization Headers (9) **Body** Scripts Settings

☐ none ☐ form-data ☐ x-www-form-urlencoded ☒ raw ☐ binary ☐ GraphQL **JSON**

```
1 2015-07-28,11:56:00,248
2 2015-07-28,12:06:00,178
3 2015-07-28,12:25:00,155
4 2015-07-28,13:56:00,121
5 2015-07-28,14:06:00,103
```

Body Cookies Headers (9) Test Results

**{}** JSON   Preview  Visualize

```
56 "Change Points Only": {
57   "Change Point": {
58     "2015-08-12": 263.9272766113281,
59     "2015-08-18": 312.7272644042969,
60     "2015-08-21": 297.6153869628906,
61     "2015-08-31": 305.75,
62     "2015-09-02": 305.75,
63     "2015-09-10": 287.375,
64     "2015-09-13": 279.5
65   }
66 }
```

To reduce the number of change points one can explicitly to provide as a 1st 3 lines in the data the following tuning parameters:

- **sValue** - Statistical band in %, where 100 is UCL=MAX, 0 is UCL=LCL=mean). (**normality**)
- **eValue** - Exception Value (EV) threshold in % of actual historical average. (**insensitivity**)
- **BaseLineLength** - The time period to compare current value against.

After adding there

sValue, 99

eValue, 20

BaseLineLength , 7

The API returns only 3 change points:

HTTP <https://api.perfomalist.com/api/controlpoints.py>

POST <https://api.perfomalist.com/api/controlpoints.py>

Params Authorization Headers (9) **Body** Scripts Settings

☐ none ☐ form-data ☐ x-www-form-urlencoded ☒ raw ☐ binary ☐ GraphQL **JSON**

```

1 eValue, 99
2 eValue, 20
3 BaseLineLength, 7
4 2015-07-28,11:56:00,248
5 2015-07-28,12:06:00,178

```

Body Cookies Headers (9) Test Results

**{}** JSON

```

56 "Change Points Only": {
57   "Change Point": {
58     "2015-08-18": 312.7272644042969,
59     "2015-09-02": 305.75,
60     "2015-09-13": 279.5
61   }

```

Putting the API output to EXCEL or Google sheet one can visualize the result by showing phases in the data between change points (see below):
