<!DOCTYPE html>
<html>
        <head>
                "Links to your CSS and tab title to your webpage go here"
        </head>
        <body> "This starts the visible part of your webpage"
                <header>
                        <h1> "This would be the title of your page" </h1>
                        <h2> "Add a second title! Who cares, no one can stop you" </h2>
                        <nav> "Now begins our navigation"
                                <ul> "So let's create an un-order list"
                                        <a href= "..."><li> "I'm a list item! And I am linked" </li></a>
                                        <a href= "..."><li> "Me too!" </li></a>
                                        <a href="..."><li> "Me three!" </li></a>
                                        <a href= "..."><li> "You get the point" </li></a>
                                </ul>
                        </nav>
                </header>
                <section>
                        "Here comes the main part of the website! Let's put tables, div
                        containers, images, videos, paragraphs, etc here"
                </section>
                <footer>
                        "We could put a link to our email or phone. That or we could provide
                        information about the date the website was updated."
                </footer>
        </body>
</html>
```

The key with html is to set up the *structure* of your website with everything *properly named* so it can be easily enhanced with CSS. Remember if you have an element inside another (like list items inside an unordered list) that you *properly indent*. See how the start and end of the body, nav, ul, and html tags are in the same column; that is not an accident!
