Abstract content

Background: The Background includes what is already known and what is not known about the subject, and so describes the purpose for the presentation and aim of study. It is important here and throughout to avoid using acronyms or perpetuating misspellings and jargon from previous work.

Methods: The Method section will include details on how the study was carried out, such as sample sizes (and variations), source of sample if limited or defined by location, any requirements for inclusion, and duration of the study. Generic drug names are preferable when describing dosage (for example, use acetaminophen as opposed to Tylenol, Johnson & Johnson Consumer, Inc., US).

Results: The Results section should have detailed findings and comparisons summarized in complete sentences. The data will be used to define the Conclusion, which may be negative, or may not be significant. If all data cannot be shared and summarized in the limited space it may be helpful to deposit data in an open repository and focus on the primary purpose.

Conclusion: In addition to briefly summarizing the results, this section may also highlight new or unexpected results and advise on future studies. Statements may only refer to the author conclusions collectively and within a wider perspective rather than offering individual and subjective opinions.

Keywords: optional, consistently applied, relevant short phrase limit of four.

Disclosures: VVWs employer received a grant from Pharmatown. The authors declared no competing interests.
