

You're the Teacher!

You've just graduated University and guess what...you're a psychology teacher! Yay! WOO! And just as luck would have it, your first unit of instruction is on **neurotransmitters** and **hormones**. *What a coincidence!*

Having just taught the unit, you now need to know what your students know (and don't know) so **your task** is to **develop an assessment**.

The assessment must have 8 question in total, 4 regarding neurotransmitters and 4 regarding hormones. The format of the question is up to you. **The point allocations per question is up to you**. However the **total points** for this activity is **set at 20 because your principal said so..**

Create the Assessment on a separate google doc. When finished, you must **give** it to a classmate. After they have taken your assessment, you need to Grade it and give them feedback! Have fun!

KEY TO CONCLUSIONS!!!! Must **CLEARLY** answer the question! Clearly state how the research serves to answer the question. Use the terms of the question when doing this!
