

## **SAMPLE** RStudio lab assignment: computing

[\[Interpretation templates\]](#)

[\[Variables in GSS\]](#)

[\[Code templates in R\]](#)

### **Assignment instructions**

In this lab assignment, there are two sections. The first section is on “Common computing issues in RStudio”, the second section is on computation in RStudio.

## Second section

### Questions

- 1) Create a frequency table for **conpress** (confidence level in press). Paste **(5 points)** ([take a screenshot](#) of the table, not all screen) and interpret the table **(10 points)**. Use [\[Interpretation templates\]](#) file.

1. Variable name (-1 point):	conpress																														
2. What it measures? (-1 point):	confidence level in press																														
3. Full wording of the question (-1 point):	Would you say you have confidence in press																														
4. Response set (-1 point):	(1: a great deal; 2: only some; 3: hardly any)																														
5. Code (-5):	frq(gss\$conpress, out = "v")																														
6. Table:	<div><div>confidence in press (x) &lt;numeric&gt;</div><table><tr><th>val</th><th>label</th><th>frq</th><th>raw.prc</th><th>valid.prc</th><th>cum.prc</th></tr><tr><td>1</td><td>a great deal</td><td>203</td><td>5.73</td><td>8.67</td><td>8.67</td></tr><tr><td>2</td><td>only some</td><td>929</td><td>26.21</td><td>39.67</td><td>48.33</td></tr><tr><td>3</td><td>hardly any</td><td>1210</td><td>34.14</td><td>51.67</td><td>100.00</td></tr><tr><td>NA</td><td>NA</td><td>1202</td><td>33.92</td><td>NA</td><td>NA</td></tr></table><div>total N=3544 · valid N=2342 · <math>\bar{x}</math>=2.43 · <math>\sigma</math>=0.65</div></div>	val	label	frq	raw.prc	valid.prc	cum.prc	1	a great deal	203	5.73	8.67	8.67	2	only some	929	26.21	39.67	48.33	3	hardly any	1210	34.14	51.67	100.00	NA	NA	1202	33.92	NA	NA
val	label	frq	raw.prc	valid.prc	cum.prc																										
1	a great deal	203	5.73	8.67	8.67																										
2	only some	929	26.21	39.67	48.33																										
3	hardly any	1210	34.14	51.67	100.00																										
NA	NA	1202	33.92	NA	NA																										
7. Interpretation:	The confidence level in press variable shows that 8.67% of the respondents have a great deal confidence; 48.33% of the respondents have only some confidence; 51.67% of the respondents have hardly any confidence in press.																														

- 2) Create a frequency table for **contv** (confidence level in tv). Paste **(5 points)** ([take a screenshot](#) of the table, not all screen) and interpret the table **(10 points)**. Use [\[Interpretation templates\]](#) file.

1. Variable name (-1 point):	contv																																										
2. What it measures? (-1 point):	confidence level in television																																										
3. Full wording of the question (-1 point):	Would you say you have confidence in television																																										
4. Response set (-1 point):	(1: a great deal; 2: only some; 3: hardly any)																																										
5. Code (-5):	frq(gss\$contv, out = "v")																																										
6. Table:	<table><tr><th colspan="6">confidence in television (x) &lt;numeric&gt;</th></tr><tr><th>val</th><th>label</th><th>frq</th><th>raw.prc</th><th>valid.prc</th><th>cum.prc</th></tr><tr><td>1</td><td>a great deal</td><td>187</td><td>5.28</td><td>8.01</td><td>8.01</td></tr><tr><td>2</td><td>only some</td><td>1075</td><td>30.33</td><td>46.02</td><td>54.02</td></tr><tr><td>3</td><td>hardly any</td><td>1074</td><td>30.30</td><td>45.98</td><td>100.00</td></tr><tr><td>NA</td><td>NA</td><td>1208</td><td>34.09</td><td>NA</td><td>NA</td></tr><tr><td colspan="6">total N=3544 · valid N=2336 · <math>\bar{x}</math>=2.38 · <math>\sigma</math>=0.63</td></tr></table>	confidence in television (x) <numeric>						val	label	frq	raw.prc	valid.prc	cum.prc	1	a great deal	187	5.28	8.01	8.01	2	only some	1075	30.33	46.02	54.02	3	hardly any	1074	30.30	45.98	100.00	NA	NA	1208	34.09	NA	NA	total N=3544 · valid N=2336 · $\bar{x}$ =2.38 · $\sigma$ =0.63					
confidence in television (x) <numeric>																																											
val	label	frq	raw.prc	valid.prc	cum.prc																																						
1	a great deal	187	5.28	8.01	8.01																																						
2	only some	1075	30.33	46.02	54.02																																						
3	hardly any	1074	30.30	45.98	100.00																																						
NA	NA	1208	34.09	NA	NA																																						
total N=3544 · valid N=2336 · $\bar{x}$ =2.38 · $\sigma$ =0.63																																											
7. Interpretation:	The confidence level in television variable shows that 8.01% of the respondents have a great deal confidence; 46.302% of the respondents have only some confidence; 45.98% of the respondents have hardly any confidence in television.																																										

- 3) Recode the responses of these variables one by one. 1 will be 3, 2 will be 2, 3 will be 1. The new variable names will be **conpressnew** and **contvnew**, respectively. Check the [\[Code templates in R\]](#) file

*You will only put the recoding codes.*

<b>Code (-5):</b>	<pre>gss\$conpressnew &lt;- rec(gss\$conpress, rec =                         "1=3 [a great deal];                         2=2 [only some];                         3=1 [hardly any]", append = FALSE)  gss\$contvnew &lt;- rec(gss\$contv, rec =                     "1=3 [a great deal];                     2=2 [only some];                     3=1 [hardly any]", append = FALSE)</pre>
-------------------	---

- 4) Use the mean -rowwise- function to create an index variable. The name of the new variable will be **confmassmediaindex** (*the confidence level in mass media index*). Check the [\[Code templates in R\]](#) file

*You will only put the computing code.*

<b>Code (-5):</b>	<pre>gss &lt;- gss %&gt;% rowwise() %&gt;% mutate (confmassmediaindex = mean (c(conpressnew, contvnew)))</pre>
-------------------	--

- 5) Create a descriptive table for **confmassmediaindex** (*the confidence level in mass media index*). Paste **(35 points)** ([take a screenshot](#) of the table, not all screen) and interpret the table **(5 points)**. Use [\[Interpretation templates\]](#) file ((*Descriptive tables 2 (for computed variables) section*)).

<b>Code (-5):</b>	<pre>descr(gss\$confmassmediaindex, out = "v", show = "short")</pre>
-------------------	--

Table:	<b>Basic descriptive statistics</b>				
	<i>Variable</i>	<i>N</i>	<i>Missings (%)</i>	<i>Mean</i>	<i>SD</i>
	dd	2311	34.79	1.59	0.54

Interpretation:	The confidence level in mass media index score of the GSS respondents is 1.59 out of 3, with standard deviation 0.54.
-----------------	---
