

Overview

Plan for keeping up with literature

From Mert R Sabuncu Tweet - keeping up with literature ([link](#))

Aligns with How to Read a Paper by S Keshav ([link](#))

In general, it's good to have a system for each project or topic.

- Have dedicated time for finding papers (1 hour per day)
 - Google Scholar - follow citations and cited by
 - Twitter
- 0. Categorize (Level 0 - 1 min per paper))

Categorize papers based on title and abstract (high, medium, low)

 - High = super relevant for my project/work
 - Categorize e.g. 10 papers per day (10 mins)
- 1. Basic Understanding (Level 1 - 10 mins per paper) - start with high priority
 - Get basic understanding of algorithm/model, problem, and data
 - Understand inputs, outputs, some modeling details, literature context
 - Aim for 3 papers per day
 - Take notes - 3-4 sentences per paper
 - Read title, abstract, introduction, conclusion, and glance at references
 - Things to assess
 - 1. Category: What type of paper is this? A measurement paper? An analysis of an existing system? A description of a research prototype?
 - 2. Context: Which other papers is it related to? Which theoretical bases were used to analyze the problem?
 - 3. Correctness: Do the assumptions appear to be valid?
 - 4. Contributions: What are the paper's main contributions?
 - 5. Clarity: Is the paper well written?
- 2. Good Understanding (Level 2)
 - Get a good understanding of the theoretical details
- 3. Replication or Baselineing (Level 3)
 - Implement the algorithm
 - Derive the theoretical results
 - Achieve the empirical results
 - 1-2 per month

Reviewing Individual Paper

From Vinay Prasad Tweet - focused on medical practice ([link](#))

Before your start

- What question am I trying to answer?
 - Should I alter my behavior?
 - Should I use this technique in my research?
 - Should I look into this finding further?
 - Is this really how the world works?
- Who has the burden of proof?
 - Is it on the authors to convince me? Or am I going to use this technique until proven otherwise?
- What other studies/techniques are out there?
 - Are they better or worse?
 - Why am I prioritizing this paper?

While reading

- Does the data presented support the inferences made?
 - Is there any confounding?
- Are there errors?
 - If so, do these errors matter?

After you finish
