

## ## Create new Clickup Tasks from Slack commands

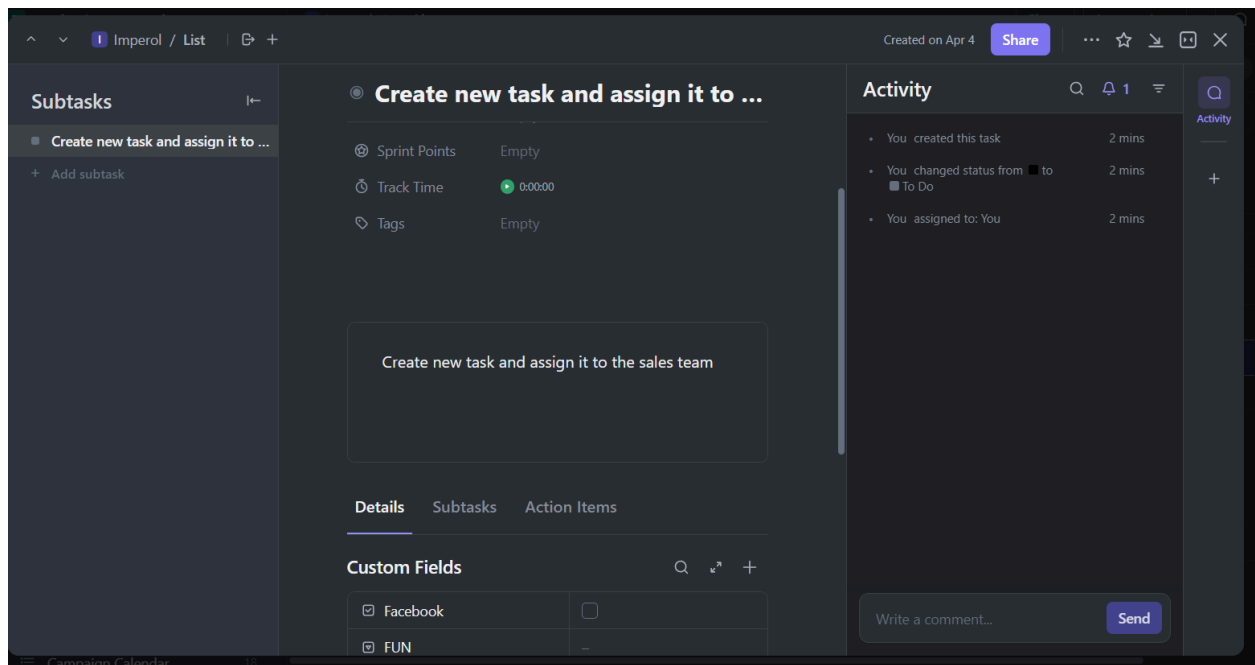

This workflow aims to make it easy to create new tasks on Clickup from normal Slack messages using simple slack command.

For example We can have a slack command as

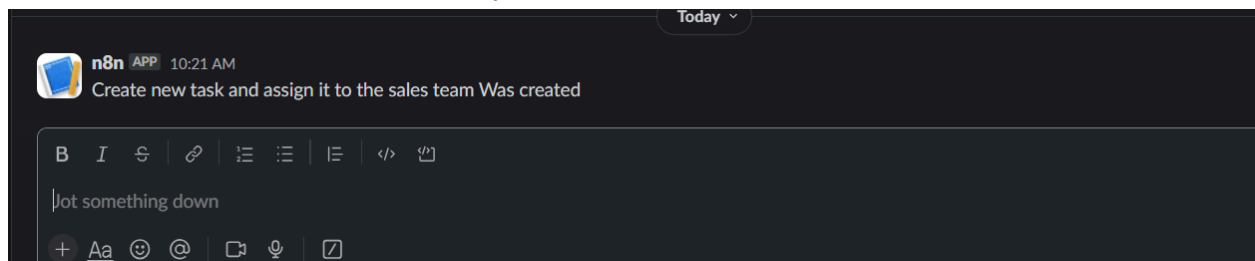

/newTask Set task to update new contacts on CRM and assign them to the sales team

This will have an new task on Clickup with the same title and description on Clickup

From this, the Workflow returns a reply with the task Created

For most teams, getting tasks from Slack to Clickup involves manually entering the new tasks into Clickup. What if we could do this with a simple slash command?

## ## Step 1

The first step is to Create an endpoint URL for your slack command by creating an events API from the link [below] <https://api.slack.com/apps/>)

# Slash Commands

Commands enable users to interact with your app from within Slack. [Learn more.](#)

Adding commands requires a [bot user](#). If your app doesn't have a bot user, we'll add one for you.

Name	Description
------	-------------

/task	Create a Clickup Task
-------	-----------------------

Create New Command

## ## STEP 2

Next step is defining the endpoint for your URL

Create a new webhook endpoint from your n8n with a POST and paste the endpoint URL to your event API. This will send all slash commands associated with the Slash to the desired endpoint

## Edit Command

Command

/task

Request URL

https://

Short Description

Create a Clickup Task

Usage Hint

Press /task to create a new task in Click...

Optionally list any parameters that can be passed.

Escape channels, users, and links sent to your app

Unescaped: @user #general

Preview of Autocomplete Entry

Commands matching "task"

Once you have tested the webhook slash command is working with the webhook, create a new Clickup API that can be used to create new tasks in ClickUp

This workflow creates a new task with the start dates on Clickup that can be assigned to the respective team members

● Create new task and assign it to the sales team
